LIMITED WARRANTY

uAvionix products are warranted to be free from defects in material and workmanship for two years from the installation of AV-30-C on the aircraft. For the duration of the warranty period, uAvionix, at its sole option, will repair or replace any product which fails in normal use. Such repairs or replacement will be made at no charge to the customer for parts or labor, provided that the customer shall be responsible for any transportation cost.

SERVICE & REPAIR: Warranty repair service shall be provided directly by uAvionix. Proof of purchase for the product from uAvionix or authorized reseller is required to obtain and better expedite warranty service.

Please email or call uAvionix support with a description of the problem you are experiencing. Also, please provide the model, serial number, shipping address and a daytime contact number. You will be promptly contacted with further troubleshooting steps or return instructions. It is recommended to use a shipping method with tracking and insurance.

RESTRICTIONS: This warranty does not apply to cosmetic damage, consumable parts, damage caused by accident, abuse, misuse, fire or flood, theft, damage caused by unauthorized servicing, or product that has been modified or altered.

DISCLAIMER: IN NO EVENT, SHALL UAVIONIX BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT OR CONSEQUENTIAL DAMAGES, WHETHER RESULTING FROM THE USE, MISUSE, OR INABILITY TO USE THE PRODUCT OR FROM DEFECTS IN THE PRODUCT. SOME STATES DO NOT ALLOW THE EXCLUSION OF INCIDENTAL OR CONSEQUENTIAL DAMAGES, SO THE ABOVE LIMITATIONS MAY NOT APPLY TO YOU.

WARNINGS / DISCLAIMERS

All device operational procedures must be learned on the ground.

uAvionix is not liable for damages arising from the use or misuse of this product.

This equipment is classified by the United States Department of Commerce's Bureau of Industry and Security (BIS) as Export Control Classification Number (ECCN) 7A994.

These items are controlled by the U.S. Government and authorized for export only to the country of ultimate destination for use by the ultimate consignee or end-user(s) herein identified. They may not be resold, transferred, or otherwise disposed of, to any other country or to any person other than the authorized ultimate consignee or end-user(s), either in their original form or after being incorporated into other items, without first obtaining approval from the U.S. Government or as otherwise authorized by U.S. law and regulations.

2. REVISION HISTORY

Revision	Date	Comments
A	4/24/2020	Initial release
B	7/13/2020	Added installation log-book entry requirement Added method to determine proper screw length Highlighted primary functions Added items included in the ICA Added startup time and AoA reference per MOPS requirement Added reference to CFR 23.1321
C	8/10/2020	Added reference to AoA operation in inverted flight and operation in excess of G limits Added reference to utilize wire type in accordance with AC 43.13-1B
D	6/3/2021	Updated Top Level Assembly references
E	9/2/2022	Software update to 2.1.2 Added Definition of Acronyms & Terms section Added requirement for pitot / static connection Add vibration check to System Checkout
F	12/3/2021	Software update to 2.1.4 Update mounting screw length guidance Add transponder control
G	5/10/2022	Update Installation Limitations Update battery guidance Update trim guidance Update mislabeled note on DG wiring diagram
H	9/29/2022	Software update to 2.1.5 Add display of bootloader version number Add BeaconX Ground Test Mode
I	2/15/2023	Add SAE AS8013A to Table 2. Add Serial 4 to Serial Inputs Add AV-Mag optional equipment description Add AV-Mag to pinout diagram Add AV-Mag wire color coding table Add AV-Mag installation and calibration Add display of AV-Mag software part number and software version number Add Pitot zero-point field calibration Add Multi-point altitude field calibration Change pitch trim limits to +-27 degrees Add additional fields to Installation Menu Setting "MAG CAL" flag added to indicate magnetometer calibration needed Add AV-Link and AV-Mag to trademarked terms list
J	5/10/2023	Add AV-Mag parallel operation Add field update pins to wiring and pin diagrams Clarify airspeed and altimeter limitation Describe installation kit contents Add tailBeaconX parallel operation figure
K	8/10/2023	Fix reference and update units on IAS Vspseds
L	12/18/2023	Update feature matrix Add AV-Link and autopilot optional interfaces

		Update power and interconnect specifications Update AV-Mag orientation options
M	2/2/2024	Add AV-Link Add extended NiMH Battery Pack Add Appendix A: Example Wiring Schematics Add Angle of Attack to Mandatory Settings Replaced guidance of AC 43.13-1B with ASTM F2639-18 Update Wiring diagrams in § 9.7 Add Pitot Zero as required during checkout Update Table 13 with new installation options
N	5/2/2024	Add instructions to set AV-Link password Clarify wording around pitot/static interfaces for DG installation Clarified max and min exposed threads for screw lengths in section 9.6 Corrected a typo in step 2.f in section 9.6 about the thread engagement calculation
O	7/30/2024	AV-Mag calibration instructions moved to section 12.3.11 Clarify wording of AV-Mag installation overview instructions Table numbering consistency Clarify optical characteristics in Table 1 Add missing AV-Link Configuration section 12.1.12 Fix reversed OAT probe wiring in Appendix A Removed redundant continued airworthiness section Add table that summarizes min and max screw thread engagement
P	3/26/2025	Global formatting updates Add AV-HSI, AV-APA, and autopilot interfaces Add Install Menu options to disable pages Add graphical G Load to the feature matrix Correction to 12.1.6. Units of V-speeds correspond to the IAS UNITS setting. Add step for configuration reset to Troubleshooting table Clarified Troubleshooting table reference to Mag Calibration procedure
Q	7/29/2025	Add wire crimp guidance: AC 43.13-1B and ASTM F2639-18 Add Wind indicator and transponder configuration to system functions Update Set Altitude alert to be both aural and visual Update AV-Mag orientation installation instructions Add QR code for configuration retrieval Updated wording of AoA performance with regard to aerobatic aircraft. Remove slanted panel AoA performance restriction Add Wind Vector to data overlay list Add Set Altitude to alert list Updated Figure 13 to AV-30-C instead of AV-30-E Clarified Angle of Attack feature controls Added WIND UNITS, BEACONX CFG, GET CONFIG, and DEVICE ID to the installation menu summary Updated format of DB-15 pinout table Updated tables of AV-HSI compatible navigators and NAV/COMM receivers Added DEVICE ID usage to section 10.1.17 Reordered IAS Trim and ALT Trim sections Update GNC-255 Connector to J2001 in Figure 39 Mounting instructions step 3 highlighted to a "NOTICE" formatted text box

		Ground bonding resistance guidance changed from red "WARNING" to yellow "CAUTION" Pinout diagram change from AUX power out to AV-Mag power out Changed section 10.2 "(i)" information statements to NOTICE text box format Updated wiring diagram for parallel tailBeaconX installation (figure 23) Fixed a text formatting problem with Table 9 Changed some instances of 'AV-30' to 'AV-30-C' Format changes to Table 21 for readability Updated references to CX80 to CNX80 Added statement to section 12.1.5 that correct setting of pitch and roll trim is required to achieve accurate angle of attack indication Added bullet to section 12.1.7 about setting TAS units Added Table 35 as a location to record AV-Mag installation settings Sections 12.2.7 and 12.2.9 add statement that the IAS trim procedure will need to be re-run after the Pitot-Zero procedure Updated Section 13 - Troubleshooting with Pitot-Zero remedy and explanation for NO MAG/MAG CAL flags Updated Table 38 GPS Serial Specification to reference NMEA message \$PGRMH for Desired Track datum
R	11/21/2025	Updated Table 31 to differentiate and correct Avidyne-only settings Added AV-Mag voltage range in addition to typical voltage Updated title page image Updated Figure 1 Added Autopilot bug to Table 5 Added HDG/TRK line to Table 5 Updated Sections 9.1 and 9.4 to call out accessories Updated Figure 106 GPS Data Elements Added caption to Table 42 AV-HSI Synchronized Data Updated footnote on Table 43 Installation Menu Setting Updated section 10.1.7 for AV-Link mounting guidance with AV-HSI Updated the pinout table to include SERIAL 1 as an identifier for Nav In and Out Updated guidance for vacuum system removal Updated GNS-480 Settings table Added minimum software version for Trio and Aerocruze to Section 10.4.2 Update section 8.2.5 Update Figure 12 Updated captions on Figures 95 and 96 Updated Table 43 Updated Section 12.1.2 Fixed spelling and formatting errors

Table 1: Revision History

3. Introduction

3.1. Purpose

This installation manual applies to the following articles:

- AV-30-C (Certified)
- AV-Mag PMA (Certified)
- AV-Link PMA (Certified)
- AV-APA PMA (Certified)
- AV-HSI PMA (Certified)

3.2. Definition of Acronyms & Terms

Acronym	Definition
ADS-B	Automatic Dependent Surveillance - Broadcast
AI	Attitude Indicator
AoA	Angle of Attack
AP	Autopilot
APA	Analog Port Adapter
ATIS	Automatic Terminal Information Service
BARO	Barometer; barometric
CDI	Course Deviation Indicator
CFI	Certified Flight Instructor
CFR	Code of Federal Regulation
CRC	Cyclic Redundancy Check
DALT	Density Altitude
DG	Directional Gyroscope
GPS	Global Positioning System
GPSS	Global Positioning System (GPS) Steering
HIRF	High-Intensity Radiated Field
IAS	Indicated Airspeed
ILS	Instrument Landing System
IMC	Instrument Meteorological Conditions
MFD	Multi-Function Display
OAT	Outside Air Temperature
OBS	Omni-Bearing Selector
SALT	Selected Altitude or Set Altitude
SVS	Selected Vertical Speed or Set Vertical Speed
TAS	True Airspeed
TSO	Technical Standard Order

Acronym	Definition
VOT	VOR Test Facility
VOR	VHF Omni-directional Range
V_{MC}	Minimum controllable airspeed
V_{YSE}	Best rate-of-climb speed with one engine inoperative
V_{SO}	Minimum stall speed with gear and full flaps. The bottom end of the ASI white arc.
V_{S1}	Minimum steady flight velocity while still controllable. The bottom end of the ASI green arc.
V_{FE}	Maximum flap extended velocity. The top end of the ASI white arc.
V_{NO}	Maximum normal operating velocity. The top end of the ASI green arc.
V_{NE}	Maximum velocity in smooth air (never exceed). The red line at the top end of the ASI yellow arc.
V_{MC}	Minimum control airspeed with the critical engine inoperative
V_{YSE}	Speed for best rate of climb OEI (single engine)

4. AV-30-C System Information

This document provides instructions on the installation requirements for the uAvionix AV-30-C multi-mode instrument and related accessories.

4.1. System Description

The uAvionix AV-30-C is a fully digital multi-mode instrument that mounts in the legacy 3-1/8" round instrument panel cutout typically found in light general aviation instrument panels. It can be field configured as either an Attitude Indicator (AI) or a Directional Gyro (DG) indicator, is fully self-contained with dual-precision inertial and pressure sensors and allows for a wide variety of pilot customization. With optional accessories, the AV-30-C can also be configured as a Multi-Function Display (MFD) or Course Deviation Indicator (CDI).

Figure 1: AV-30-C Multi Mode AI/DG/Transponder - Basic Display

When configured as an AI, primary attitude and slip are always displayed. The unused portions of the display area can be customized by the pilot to show a variety of textual and graphical data-overlay

fields. Up to three pages may be customized by the pilot while the last page presents a fully decluttered view of only attitude and slip or control of a compatible uAvionix ADS-B transponder such as the tailBeaconX.

When configured as a Directional Gyro (DG), non-slaved direction of flight information is presented. The non-slaved direction can be manually adjusted by pilot input, aided by the optional AV-Mag accessory, or may be optionally slaved to GPS track. Multiple display presentations, including compass rose, GPS HSI, and GPS arc views can be selected by the pilot. The unused portions of the display area can similarly be configured for a variety of textual data overlays.

With an optional AV-Link accessory, the AV-30-C can be configured as a Multi-Function Display (MFD) that displays traffic from ADS-B receivers. MFD and DG modes are accessible when the AV-30-C is configured as a DG. As with other operating modes, the last page provides a reversionary AI.

With an optional AV-HSI accessory, the AV-30-C can be configured as a Course Deviation Indicator (CDI). Two CDI pages are available, with the third providing a reversionary AI. As with other modes, unused portions of the display area can be configured with textual data overlays.

In all operating modes, the pilot may select from multiple visual styles which are intended to improve visual compatibility with legacy aircraft instrumentation and preserve the look-and-feel of older aircraft applications.

When installed as a non-required instrument (not replacing the existing approved AI or DG), the functional mode of the unit can be toggled between AI, DG, MFD, and CDI modes by pressing and holding the center knob for 3 seconds.

A wide variety of supplemental functions, including audio alerting, derived angle of attack presentation, g-load display, and more are provided. An internal, rechargeable battery allows for operation for a nominal 2.5 hours in the event of aircraft power loss and 30 minutes (minimum) operation under all temperature conditions.

See *AV-30-C Pilot's Guide UAV-1003946-001* for additional details.

4.2. System Functions

The AV-30-C includes the following functions:

Primary Functions

- Primary Attitude (AI Mode)
- Primary Slip (AI Mode)
- Primary Direction of Flight indication (DG Mode)
- Primary Navigation Information (with optional AV-HSI)

Supplemental Functions

- Indicated Airspeed
- Altitude
- Rate of Turn
- Standard Rate Bank Angle
- V-Speeds
- Wind Vector
- Angle of Attack
- Vertical Trend
- Vertical Speed
- Set Altitude (SALT)
- Set Vertical Speed (SVS)
- Heading
- Bus Voltage
- G Load
- G-Max and G-Min Hold
- Outside Air Temperature
- True Airspeed
- Density Altitude
- GPS Navigator / Waypoint Data
- GPS Navigator / Flight Plan
- Rate of Climb in Feet per Nautical Mile
- Heading Bug
- Traffic page (requires AV-Link)
- Transponder control (AI / DG / MFD / CDI Mode)
- Transponder setup and configuration
- Autopilot control

Audio and Visual Alerting Functions

- AoA Alerting
- G Limit Alerting
- Excessive Roll Alerting
- Set Altitude Alerting
- Attitude Miscompare (with AV-HSI)

- Carbon Monoxide (with AV-Link and Sentry)
- Over/Under Voltage (visual only)

Miscellaneous Functions

- Internal Battery Operation
- Auto/Manual Brightness

Electrical Attributes	
Input Voltage Nominal	+10 to +32 VDC
Input Voltage Max	+60 VDC
Input Power Nominal	6 Watts (0.5 Amps @ 12VDC)
Input Power Max	12 Watts (1.0 Amps @ 12VDC)
Required Circuit Breaker	2 Amp
Physical Attributes	
Mounting Configuration	3-1/8" Round Instrument Hole
Electrical Connector	15 Pin Male D-Sub
Pneumatic Connectors	1/4" OD Quick Connect
Mounting	(4X) #6-32 Machine Screws
Case Material	Billet Aluminum
With Standard Lithium-Ion Battery Pack UAV-1003429-001 or UAV-1003429-002	
Dimensions w/o Connector	3.38" x 3.38" x 2.49"
Weight	0.56 Lbs.
Operation on Battery	1 Hr. Typ. @ 20°C / 30 Min Minimum @ -20C
With Extended NiMH Battery Pack UAV-1003429-003	
Dimensions w/o Connector	3.38" x 3.38" x 3.49"
Weight	0.90 Lbs.
Operation on Battery	2.5 Hr. Typ. @ 20°C / 30 Min Minimum @ -20C
Environmental	
Ground Survival Low	-55°C
Operating Low	-20°C
Ground Survival High	+85°C
Operating High	+55°C
Altitude	25,000 Feet (maximum)
Optical Characteristics	
Diagonal Size	3" Circular
Contrast Ratio (Typical)	500
Brightness (Typical)	1000 cd/m ²
Viewing Angle Left/Right	60°
Viewing Angle Up	45°

Viewing Angle Down	10°
--------------------	-----

Table 3: System Specifications

5. Certification

This installation manual provides mechanical and electrical information necessary to install the AV-30-C and related accessories. The content of this manual assumes use by competent and qualified personnel using standard maintenance procedures in accordance with Title 14 of the Code of Federal Regulation (CFR) and other related accepted procedures.

The certification basis for the AV-30-C is 14 CFR Part 23, Amendment 23-61. Installation is approved as a Level A system and is robust to High Intensity Radiated Field (HIRF) and lightning levels applicable for both metallic and non-metallic aircraft.

NOTICE

The AV-30-C is approved for primary attitude, slip, direction of flight and navigation indication.

All other functionality is supplemental in nature and may not satisfy regulatory requirements for required instrumentation.

CAUTION

The installer must ensure that all installation limitations as defined in this document are observed.

The internal battery capacity has been tested and verified to provide 30 minutes of operational capacity (with reserve), and meets the requirements defined in CFR 23.1311(a)(5) and 23.1353(h), allowing independent operation from the primary electrical power system.

See Section 8.3 for additional battery operational characteristics.

NOTICE

The AoA indicator is for positive (upright) angle of attack warnings. For aircraft capable of acrobatic flight, critical warnings for inverted flight will not be indicated and may become unreliable for maneuvers exceeding ± 8 G.

5.1. Mechanical Instrument Replacement

Approval is granted to replace legacy mechanical instrumentation as follows:

- Installation of the AV-30-C (Dedicated AI mode) as the primary source for attitude and slip. Installation replaces the existing stand-alone vacuum or electrically powered attitude indicator.
- Installation of the AV-30-C (Dedicated DG mode) as the primary source for direction-of-flight. Installation replaces the existing stand-alone vacuum or electrically powered non-slaved directional gyro indicator.
- Installation of the AV-30-C as the primary navigation indicator, replacing an existing HSI (Dedicated DG mode) or CDI.

Note that when installed as a DG, a reversionary AI is available for display. The reversionary AI functionality is supplemental only and does not satisfy requirements for a backup or standby attitude, turn and slip, or turn coordinator.

Refer to FAA Advisory Circular 91-75 for guidance on replacing a turn coordinator with an AV-30-C.

5.2. Non-Required Instrument Addition

Approval is granted to install the AV-30-C as a non-required instrument, augmenting existing required instrumentation.

5.3. Vacuum System Removal

The aircraft's vacuum system typically may be removed if no other systems or equipment requires it. However, this STC does not provide guidance or approval for this alteration.

5.4. Applicable Performance Standards

The AV-30-C and associated accessories were designed to and satisfied the applicable performance requirements defined in the following design standards:

MOPS	Title	Category
SAE AS8019	Airspeed Instruments	Type B
SAE AS392C	Altimeter, Pressure Actuated, Sensitive Type	Type I
SAE AS8005A	Minimum Performance Standard Temperature Instruments	Class IIIc
SAE AS8034	Minimum Performance Standard for Airborne Multipurpose Electronic Displays	N/A
RTCA DO-334	Minimum Operational Performance Standards (MOPS) for Strapdown Attitude and Heading Reference Systems (AHRS)	A5 H9 T7

MOPS	Title	Category
SAE AS8013A	Minimum Performance Standard for Direction instrument, Magnetic (Gyroscopically Stabilized)	N/A
ASTM F3011-13	Standard Specification for Performance of Angle of Attack System	N/A
RTCA DO-347	Certification Test Guidance for Small and Medium Sized Rechargeable Lithium Batteries and Battery Systems	Medium Size
RTCA DO-293A	Minimum Operational Performance Standards (MOPS) for Nickel Cadmium, Nickel Metal-Hydride, and Lead-Acid Batteries	N/A
SAE AS6296	Electronic Flight Instrument System (EFIS) Displays	N/A

Table 4: Applicable Performance Standards

6. Installation Limitations

The following section provides the FAA approved installation limitations.

6.1. Installation Approval Limitations

This article meets the minimum performance and quality control standards required by an Approved Model List - Supplemental Type Certificate (AML-STC) and when installed on aircraft approved on the AML can be approved for return to service after installation.

If installation for an aircraft that is not listed on the AML, separate approval must be obtained. The following installation limitations apply:

- Installation is restricted to CFR Part 23, Class I and II (gross take-off weight of no more than 6000 lbs) aircraft.
- Installation is restricted to aircraft with a 25,000-foot maximum (or less) ceiling limitation.
- Installation is restricted to aircraft with equal to or less than 300 knot V_{NE} airspeed.
- Installation cannot replace a primary attitude indicator that is part of an autopilot system. An existing attitude indicator that is part of an autopilot may be moved to a non-primary location and the AV-30-C may be installed in the primary location.
- Installation cannot replace a flight director that is part of an autopilot system.
- Installation cannot replace a turn coordinator that is part of an autopilot system.
- In installations where the primary attitude indicator is being replaced, the existing airspeed and altimeter must remain in their current locations.
- An electrical load analysis must be performed in association with the installation.
- Connection to the audio interface is not allowed for IFR approved non-metallic aircraft due to indirect lightning protection limitations.
- A magnetic direction indicator (compass) must be installed in the aircraft.
- An EMI/EMC checkout must be performed in association with the installation (This limitation is added to ensure verification of non-interference with Wi-Fi functionality).
- A magnetic interference checkout must be performed in association with AV-Mag installation.

7. Installation Locations & Operating Modes

7.1. Installation Locations

The following figure shows a typical “six-pack” and one possible arrangement of instrument locations:

Figure 2: Mechanical Gauge Replacement

Note that the physical arrangement in many aircraft varies from the configuration shown above. The AI/DG/MFD/CDI locations are examples of installation locations as a backup or supplemental instrument.

NOTICE

The existing mechanically based altimeter and airspeed indicator must remain in their current locations for this installation configuration.

Reference CFR 23.1321 Arrangement and Visibility for additional FAA guidance on instrument installation location.

7.2. Operating Mode Configuration

The AV-30-C operating mode is configured during installation and can be set as follows:

- Unit locked as a dedicated Attitude Indicator (AI Mode)
- Unit locked as a dedicated Direction Indicator (DG Mode); can be toggled between DG and MFD by the pilot.
- Unit unlocked; can be toggled between AI, DG, MFD, and CDI Modes by the pilot.

Installations where dedicated functionality is required must have the associated setting configured in the setup procedures. This setting is mandatory and non-pilot accessible.

If the functionality is not locked, pressing and holding the rotary knob will toggle between AI, DG, MFD, and CDI modes. This mode is only applicable for installation as a non-required instrument.

NOTICE

An AV-30-C that replaces the required Attitude Indicator must have the operating mode locked as an AI.

Installation as a pilot configurable AI/DG may not replace a required primary instrument.

An AV-30-C installed as a non-required indicator may be configured in any operating mode based on pilot preference.

Replaced instruments may NOT be part of an autopilot system such as the rate-of-turn source for an autopilot or display of flight director information from an autopilot.

Reference CFR 23.1321 Arrangement and Visibility for additional FAA guidance on instrument installation location.

8. Functionality and Required Interfaces

8.1. Aircraft Systems Connections

All aircraft systems connections are provided on a single 15-Pin D-sub connector and two quick-connect pneumatic fittings. Various interfaces are optional, and interface to some systems may require additional installation approval. Do not plug the pitot and static lines.

Figure 3: AV-30-C Aircraft Systems Interfaces – AI Mode

Figure 4: AV-30-C Aircraft Systems Interfaces – DG Mode

8.2. Feature Matrix

The following matrix shows primary and supplemental data and any required external interface.

Feature	AI Mode	DG Mode	Required Interface
Primary Attitude and Slip			
Primary Attitude	✓	×	Pitot & Static
Primary Slip	✓	×	Pitot & Static
Reversionary Attitude / Slip	✓	✓	Pitot & Static
Primary Direction of Flight Indication			
Direction Tape (DG / [GPS])	✓	×	Pitot & static / [GPS Navigator]
Direction Rose (DG / [GPS])	×	✓	Pitot & static / [GPS Navigator]
Direction Arc (DG / [GPS])	×	✓	Pitot & static / [GPS Navigator]
Direction HSI (DG / [GPS])	×	✓	Pitot & static / [GPS Navigator]
Primary Navigation Indication			
GPS Enroute	✓	✓	AV-HSI, AV-Mag, GPS Navigator
GPS Approach - Lateral and Vertical Guidance	✓	✓	AV-HSI, AV-Mag, GPS Navigator

Feature	AI Mode	DG Mode	Required Interface
VOR	✓	✓	AV-HSI, AV-Mag, VOR Receiver
ILS	✓	✓	AV-HSI, AV-Mag, ILS Receiver
Supplemental Data Overlays – Pilot Configurable (Textual or Graphical)			
Indicated Airspeed (Textual)	✓	×	Pitot & Static
V-Speeds (Graphical)	✓	×	Pitot & Static
Baro Altitude (Textual)	✓	✓	Pitot & Static
Rate of Turn	✓	×	Pitot & Static
Standard Rate Bank Angle	✓	×	Pitot & Static, OAT Probe
Angle Of Attack (Graphical)	✓	×	Pitot & Static
Vertical Trend (Graphical)	✓	×	Pitot & Static
Vertical Speed (Textual)	✓	✓	Pitot & Static
Set Altitude (Textual)	✓	✓	None
Heading (Textual)	✓	✓	Pitot & Static
Bus Voltage (Textual)	✓	✓	None
G Load (Graphical)	✓	×	None
G Load (Textual)	✓	✓	None

Internal Magnetometer aid	✓	✓	Optional hardware, Pitot & Static
External Magnetometer aid	✓	✓	AV-MAG, Pitot & Static

Table 5: Feature Matrix

8.2.1. Power Input (Required)

Power input is required in all configurations. The power input is internally connected, and diode protected with the unit's internal battery via a processor-controlled switch. This architecture allows the unit to continue operation if external power fluctuates or is completely lost. Input range is compatible with both 12V and 24V aircraft.

Each AV-30-C must have a dedicated, properly labeled, pilot resettable circuit breaker as part of the installation. Power for the unit should be supplied from the main battery master relay. It is recommended to shield the power wire.

8.2.2. Pitot and Static Interfaces (Required)

Pitot and static connections are required for all installations, regardless of operating mode: AI, DG, MFD, or CDI.

Airspeed, altitude, attitude, derived angle of attack (AoA), True Airspeed (TAS), Density Altitude (DALT), DG heading, and traffic altitude all require pitot and static connections as they are based on either altitude or airspeed measured from those connections.

When installed as a DG, backup battery in flight, and DG heading aid require the pitot and static connections to be connected. Air data also aids the attitude algorithm, using a feature called speed assist.

8.2.3. Outside Air Temp Input (Optional)

The optional outside air temperature interface requires a dedicated external analog probe. This port connection is compatible with the Davtron P/N C307PS (not supplied).

This is a differential two-wire current source based on the Analog Devices AD590KH component and supplies a current that corresponds to the ambient temperature.

CAUTION

If two displays are connected to the same probe, the current will be split between the two and incorrect readings will be shown by both.

The sensor reading must be trimmed during the installation process to compensate for probe-to-probe variations.

The OAT probe is automatically detected by the system, and when detected, allows temperature related parameters to be selected for display by the pilot.

If the OAT probe is not detected, display of these parameters will automatically be inhibited.

8.2.4. Audio Output (Optional)

The optional audio panel connection is a low-voltage analog output that is designed to connect directly to an audio panel (typically a non-switched or unswitched audio input). High power outputs capable of directly driving a cockpit speaker are not provided.

Other unswitched unmuted inputs can be used but they may need to be mixed with an existing audio source. Audio shields must be grounded only at audio panel to avoid ground loops. Contact audio panel manufacturer for further instructions.

When installed as a DG, no audio alerting is supported, and this output should remain disconnected.

WARNING

In non-metallic, IFR capable aircraft, this connection **MUST** remain disconnected due to lightning strike limitations.

8.2.5. Navigation Interface (Optional)

The Navigation Interface is an optional RS-232 serial interface that can be connected to one of the following:

- "Aviation" output provided by most panel mounted GPS units
- NMEA output provided by most handheld GPS units
- AV-HSI (Horizontal Situation Indicator) that can be connected to the following:
 - One GPS Source (either ARINC 429 or NMEA)
 - One VOR/ILS Source (either ARINC 429 or Apollo SL30 protocol)
- tailBeaconX or echoESX transponder GPS input

Navigation data may also come from a wireless GPS input as described in *AV-Link Interface* Section 8.2.10.

This interface receives text/binary output from a navigator that contains situational awareness information such as ground speed, track, distance to destination, cross track, etc., and is typically utilized by remote mapping/display products to provide additional pilot awareness.

Aviation, NMEA, and tailBeaconX or echoESX GPS data does not provide IFR compliant lateral or vertical guidance, therefore all deviation related data presented in this configuration is for VFR operations only.

The AV-HSI provides IFR compliant lateral and vertical guidance when connected to an ARINC 429 Navigator or NAVCOM.

The AV-30-C will convert groundspeed units to match units of airspeed, but otherwise does not alter the data obtained from the GPS navigator.

NOTICE

Aviation and NMEA GPS may be connected in parallel between multiple AV-30-C units and is supported in both AI and DG modes.

The supported protocols are contained in Section 16.

GPS Receiver	GPS Track	VFR Guidance	IFR Guidance	MFD Traffic Display
uAvionix BeaconX	✓	×	×	×
Aviation Serial	✓	✓	×	×
NMEA	✓	✓	×	×
AV-HSI + ARINC 429 GPS	✓	✓	✓	×
AV-Link + ADS-B Receiver	✓	×	×	✓
AV-Link + ForeFlight	✓	✓	×	×
AV-Link + ForeFlight + ADS-B Receiver	✓	✓	×	✓

Table 6: GPS Functions by receiver type

Table 6 depicts the GPS functions performed by each receiver type. tailBeaconX or echoESX transponders provide GPS track but do not have a waypoint database to provide navigation guidance.

NOTICE

The AV-HSI is not powered by the AV-30-C internal battery. Navigation information will be unavailable during a power loss.

8.2.6. Internal Magnetometer (Optional)

The internal magnetometer, when available, is detected in software version 2.1.2 or later. It is currently disabled by configuration.

8.2.7. AV-Mag External Magnetometer (Optional)

The AV-Mag external magnetometer is supported in software version 2.3.9 or later. It is enabled with manual configuration in the installation menu. The installation of the AV-Mag magnetometer is sensitive to orientation and tilt so the installation instructions and measurements must be followed carefully. The magnetometer requires calibration before use. The AV-Mag receives power from the AV-30-C and will run off the AV-30-C backup battery in case of power loss. The AV-Mag transmits data to the AV-30-C via an RS-232 serial interface.

NOTICE

The RS-232 serial interface may be connected in parallel to multiple AV-30-C units.

8.2.8. Transponder Control (Optional)

The AV-30-C can be used as the control interface for select uAvionix transponders (including the tailBeaconX and echoESX). This provides pressure altitude, mode, squawk code, and IDENT information to the transponder, and displays status and annunciations from the transponder.

NOTICE

The transponder is not powered by the AV-30-C internal battery. Transponder operations will be unavailable during a power loss.

8.2.9. Transponder Configuration (Optional)

The AV-30-C can be used as the configuration interface for select uAvionix transponders (including the tailBeaconX and echoESX). This allows setting a default squawk code, ICAO number, tail number, emitter type, aircraft length and width etc.

8.2.10. AV-Link Interface (Optional)

The AV-30-C has the option of being a traffic display using AV-Link as an integrated Wi-Fi bridge that allows for communication between AV-30-C and Wi-Fi capable ADS-B receivers. The AV-30-C will display a separate MFD page with traffic when appropriately configured and connected to a supported receiver.

Starting with software version 3.2.0, the AV-30-C can use the AV-Link to display flight plans from ForeFlight. When combined with a GPS position from an ADS-B receiver or from ForeFlight's iPad or iPhone, the AV-30-C computes additional navigation data, including autopilot guidance, from ForeFlight's flight plan. This capability can be enabled from the traffic mode menu or the setup menu while in other modes. See *AV-30-C Pilot's Guide UAV-1003946-001* for details.

ForeFlight integration requires AV-30-C version 3.2.0 and AV-Link version 0.3.7 or newer. If using the AV-Link with an AV-HSI, the AV-HSI must have software version 1.1.0 or newer.

NOTICE

The AV-Link accessory is not powered by the AV-30-C internal battery. Wi-Fi traffic data provided to the MFD mode will be unavailable during a power loss.

8.2.11. Autopilot Interfaces (Optional)

The AV-30-C has options to control select analog and digital autopilots. Analog autopilots are controlled through the optional AV-APA accessory. Digital autopilots can be controlled through the AV-HSI using ARINC 429. Digital autopilots do not require the AV-APA.

NOTICE

The AV-APA is not powered by the AV-30-C internal battery. Analog autopilot operations will be unavailable during a power loss.

8.3. Internal Battery Operation

The internal battery consists of a rechargeable battery system with automatic recharge, self-test, and power switching capability.

AV-30-C part numbers UAV-1003429-001 and UAV-1003429-002 include a standard Li-Ion battery pack that will provide approximately 1 hour of operation at standard temperatures and 30 minutes (minimum) of operational capacity over the operational temperature range.

AV-30-C part number UAV-1003429-003 includes an extended NiMH battery pack that will provide approximately 2.5 hours of operation at standard temperatures and 30 minutes (minimum) of operational capacity over the operational temperature range.

When power is lost to the AV-30-C, the following will occur:

1. While AV-30-C is aligning, the unit will continue in battery mode if power is lost. Once aligned the shutdown process will start.
2. If any button is pressed after power is lost, the AV-30-C will stay in battery mode.
3. If the AV-30-C senses airspeed or GPS groundspeed, it will stay in battery mode. For this reason, it is crucial that the AV-30-C is connected to pitot and static air system.

If the AV-30-C needs to be shut down after removing power, push and hold the left and right buttons simultaneously until the unit shuts down.

See the *AV-30-C Pilot's Guide UAV-1003946-001* §8 Internal Battery Operation for additional operational information.

9. Equipment Installation

9.1. Overview

Installation consists of the following steps:

- Remove / relocate any legacy instrumentation
- Add or locate an appropriate power source / breaker
- Mount on-board accessories in their appropriate locations (AV-HSI, AV-HSI + AV-Link, AV-APA)
- Wire power, accessory interfaces and third party interfaces as needed
- Mount the unit to the instrument panel with supplied screws
- Connect pitot and static to both AI and DG. Perform leak check after installation
- Apply power and perform setup
- Install optional AV-Mag and perform setup and calibration

9.2. Supplied Components

This installation manual is applicable to the following components and part numbers:

Component	Part Number	Description
AV-30-C Unit	UAV-1003429-001	AV-30-C Unit
	UAV-1003429-002	AV-30-C Unit with Internal Magnetometer
	UAV-1003429-003	AV-30-C Unit with Extended NiMH Battery Pack
AV-30-C Installation Kit	UAV-1004091-001	Installation Kit
AV-30-C Operating Software	UAV-1003494-010	AV-30-C Operating Software v3.2.0
AV-Mag (optional)	UAV-1006518-001	AV-Mag External Magnetometer
AV-Link (optional)	UAV-1004414-001	AV-Link
AV-APA (optional)	UAV-1007840-001	AV-APA Analog Port Adapter
AV-HSI (optional)	UAV-1007846-001	AV-HSI Horizontal Situation Indicator

Table 7: Supplied Components

The AV-30-C Installation Kit includes the following:

- 6-32 mounting screws
- 15-pin harness housing and associated pins
- Braided ground cable
- Ring terminals

NOTICE

The installation kit has been updated to use machined pins instead of the original stamped pins.

If your kit includes machined pins, a Daniels AFM8 crimp tool using a K13-1 positioner or equivalent M22520/2-01 tool should be used. If your installation kit includes the original stamped pins, a NorComp 180-701-170-000 hand crimper or equivalent should be used.

FAA AC 43.13-1B provides general guidance on wire crimping. For detailed instructions, refer to the operating instructions provided by the crimp tool manufacturer.

9.3. Non-Supplied Components

The following components may be required but are not included:

Component	Description
Pitot / Static Tubing	Length as required
Pitot Static T's	Quantity as required
Circuit Breakers (2A)	One required for each instrument
OAT Probe (optional)	Davtron P/N C307PS
Power and Interconnect Wire	22 or 24 AWG MIL-C-27500 shielded wire

Table 9: Non-Supplied Components

9.4. Installation Records

The date of installation should be recorded in the aircraft's logbook.

Entry should include instrument(s) being replaced (AI or DG, or both), or, if the installation is being performed as a non-required instrument.

Entry should also include a description of any optional accessories and connections.

Entry should include AV-Mag installation location, orientation, and attitude angles.

9.5. Mechanical Drawing

AV-30-C part numbers UAV-1003429-001 and UAV-1003429-002 include a standard depth Li-Ion battery pack, with mechanical dimensions shown in Figure 5. The center drawing depicts an AV-30-C with an optional AV-Link attached.

Figure 5: Mechanical Drawing with Standard Li-Ion Battery

AV-30-C part number UAV-1003429-003 includes an extended NiMH battery pack, with mechanical dimensions shown in Figure 6. The center drawing depicts an AV-30-C with an optional AV-Link attached.

Figure 6: Mechanical Drawing with Extended NiMH Battery

9.6. Mounting Screw Length Restriction

The AV-30-C is fastened to the instrument panel with four Stainless Steel 6-32 screws. The unit mounts from the rear of the instrument panel, with the screws being inserted from the front of the panel.

CAUTION

The four 6-32 Mounting screws **must** observe depth limits given the internal component design. Using screws that are too long can break the housing and damage the components inside. For top screws, the maximum exposed thread length is 3.2 mm and the minimum is 2.7 mm. For bottom screws, the maximum is 4.2 mm and the minimum is 3.7 mm.

NOTICE

Torque screws to 6 (+/-1) inch-lbs. Do not over-torque or damage may occur.

Figure 7: Mounting Screw Depth Limits

Caution must be observed when mounting the AV-30-C. If too long a screw is used, damage to the unit can occur, and the unit may not be securely fastened to the panel. The installation kit contains multiple length screws to assist in compensating for different instrument panel thicknesses. Due to the short thread engagement, if you will be providing your own screws, be sure to choose stainless steel instead of brass as typically used for instrument mounting.

The objective when mounting the AV-30-C is to achieve the greatest screw engagement without exceeding the limits of the housing, causing damage. Using screws that are too short could lead to stripped mounting holes. Always use caution when tightening the mounting screws, if the screw feels like it is bottoming out, STOP, and correct the screw thread engagement. Correct screw thread engagement may be determined and adjusted in the following ways.

Figure 8: Install tool used for Top and Bottom Screw Engagement Check

Figure 9: Proper Screw Engagement Adjustment

1. Installation Tool: If the installation kit contains a screw depth gauge, perform the following steps to determine the correct screw lengths:
 - a. Hold the depth gauge behind the panel so the "T" hole on the depth gauge aligns with the top left screw hole in the panel. Place a mounting screw through the panel and feel the back surface of the tool where the screw should be. The screw can be flush with the tool surface or up to 0.5mm (0.020in) below the surface. If the screw protrudes past the depth gauge the screw is too long. Select a shorter screw or use standard hardware shims/washers installed under the head of the screw (not provided) to adjust the screw depth.
 - b. Perform step a. again, measuring the top right screw hole.
 - c. Hold the depth gauge behind the bottom left screw hole, aligning the "B" hole on the depth gauge with the panel screw hole. Again, if the screw protrudes past the depth gauge the screw is too long. Select a shorter screw or use standard hardware shims/washers installed under the head of the screw (not provided) to adjust the screw depth.
 - d. Perform step c. again, measuring the bottom right screw hole. Note that the lower two holes accommodate slightly longer screws than the upper two holes, but the same process should be used to achieve the greatest thread engagement.

2. Measurement: The permissible thread engagement in the top mounting holes is 3.2mm. The permissible thread engagement in the bottom mounting holes is 4.2mm.

Hole	Minimum Engagement	Maximum Engagement
Top	2.7 mm	3.2 mm
Bottom	3.7 mm	4.2 mm

You can use digital calipers or other accurate means to measure the length of the screw (each screw may have manufacturing length variation), then measure your panel thickness. Subtract the panel thickness from your screw length. If this length is greater than 3.2 or 4.2 for each respective Top or Bottom location, you will need to add washers when installing the screws. Repeat this measurement of exposed threads with shims/washers on the screws until you are under and within 0.5mm (0.020in) of the listed depths.

- a. Screw thread length measured = 6.35mm (0.250in screw)
- b. Panel thickness measured = 2.29mm (0.090in panel)
- c. Thread engagement = $6.35 - 2.29 = 4.06\text{mm}$
 - This screw may be used in the Bottom Mounting holes since $4.06\text{mm} < 4.2\text{mm}$, but NOT in the top mounting holes as it is too long.
- d. Screw thread length measured = 4.76mm (0.1875in screw)
- e. Panel thickness measured = 2.29mm (0.090in panel)
- f. Thread engagement = $4.76 - 2.29 = 2.47\text{mm}$
 - This screw may NOT be used in the Top or Bottom Mounting holes since the length is too short. You will need to use a longer screw or a longer screw with shims/washers.

NOTICE

Installing an AV-30-C into panel cutouts where one of the 4 mounting hole locations has been enlarged for prior Baro Setting knob, DG Adjustment knob, or Heading Bug knob clearance will increase the mounting difficulty. Use extreme caution when using reducing washers while adjusting screw engagement in these locations. The reducing washers will flex more than traditional washers causing the screws to have deeper engagement. You can still use the installation tool in this case by turning the tool over and aligning the Bottom depth gauge hole with the mounting hole while 'bridging' the tool across the opening to ensure it is flat on the back of the panel as shown below. Insert your reducing washer and screw and repeat the process from 1c above. Use caution when tightening the screw.

Figure 10: Bridging using back side of tool when working with enlarged holes and reducing washers.

9.7. Wiring Diagrams

The AV-30-C performs different functions when installed as an AI, DG, MFD, or CDI and therefore wiring varies based on installation. Figure 11 shows the required connections for all AV-30-C installations. Figure 12 shows the wiring of optional analog accessories and measurement devices. Figure 13 shows the wiring of optional digital accessories. Installation is likely to be an aggregate of these three figures.

Use 22 or 24 AWG MIL-C-27500 or equivalent shielded wire unless otherwise specified in the installation drawings. See *ASTM F2639-18 Standard Practice for Design, Alteration, and Certification of Aircraft Electrical Wiring Systems* §5.1 for additional guidance where needed.

Figure 11: Wiring Diagram - Required Connections

NOTES:

1. USE 22 OR 24 AWG MIL-C-27500 SHIELDED WIRED.
2. AV-MAG MAY BE PARALLELED TO ADDITIONAL AV-30. FOR PARALLEL OPERATION CONNECT PINS 6, 10, AND SHIELD TO ADDITIONAL AV-30. DO NOT CONNECT PIN 13 TO ADDITIONAL AV-30.
3. AV-MAG INCLUDES APPROXIMATELY 12" OF WIRE. EXTEND WITH M27500-24TG3T14, M27500-22TG3T14 OR EQUIVALENT.
4. FOR DALT, TAS, OAT, FUNCTIONALITY, PITOT, STATIC, AND OAT MUST ALL BE CONNECTED. OAT PROBE CAN NOT BE PARALLELED.
5. AUDIO ALERTS FOR THE AI CONFIGURATION ONLY. DO NOT CONNECT IF INSTALLED AS DG.
6. DO NOT CONNECT WIRE SHIELD FOR AUDIO AT AV-30. CONNECT SHIELD ONLY AT AUDIO PANEL.
7. CONNECT AV-MAG SHIELD TO AV-30 BACK SHELL AND TO AV-MAG.

Figure 12: Wiring Diagram - Optional Connections 1 of 2

Figure 13: Wiring Diagram - Optional Connections 2 of 2

9.8. Bonding Requirements

The following figure shows the grounding requirements for the electrical connections. The two D-Sub screws are to be utilized for shield and ground strap connections.

The supplied ring terminal connectors are sized for these screws.

The ground braid strap is to be less than 8 inches in overall length and at least 3/16 width. Use Alpha Wire part number 1230 SV001 or equivalent.

Figure 14: Ground Braid Strap - 8" or less in Length

The exposed (non-shielded) portions of the interface cables AND the shield grounds are to remain less than 2.5 inches.

Figure 15: Shielded Cable

CAUTION

The bond between the unit (measured at the D-sub screws) to the aircraft frame must be 2.5 milliohms or less.

Figure 16: Cable Shields and Ground Strap

9.9. Unit Pinout

The AV-30-C DB-15 connector pins perform the following:

Pin	Function	Type	Comment
1	Power	Power	+12 to +28 VDC
2	Serial 1 - Navigation In	Input	GPS or AV-HSI RS-232
3	Serial 1 - Navigation Out	Output	AV-HSI RS-232
4	Serial 2	Input	Transponder or AV-APA
5	Serial 2	Output	Transponder or AV-APA
6	Serial 4	Input	AV-Mag Data
7	OAT Supply	Output	White Probe Wire
8	MFG Serial	Input	Field Update
9	Ground	Power	Aircraft Ground
10	Aux Power Ret	Power	AV-Mag / Auxiliary Power return
11	Audio H	Output	Audio Alerts Hi
12	Audio L	Output	Audio Panel Lo
13	AV-Mag	Power	Out Power AV-Mag / Auxiliary Power
14	OAT Return	Input	White / Blue Probe Wire
15	MFG Serial	Output	Field Update

Table 11: Connector Pinout

Figure 17: Unit Connections - DB-15, Male (Rear Unit View)

10. Optional Equipment Installation

10.1. AV-Link

AV-Link (P/N UAV-1004414-001) is an integrated Wi-Fi bridge that allows for communication between AV-30-C and Wi-Fi enabled devices. Software updates for AV-Link and AV-30-C can be performed via a web page. Configuration settings and device status are accessible through the embedded web page. See Section 10.1.15 for steps on updating firmware using the AV-Link.

This installation manual provides mechanical and electrical information necessary to install AV-Link. It is not equivalent to an approved airframe-specific maintenance manual, installation design drawing, or installation data package. The content of this manual assumes use by competent and qualified personnel using standard maintenance procedures in accordance with Title 14 of the Code of Federal Regulation (CFR) and other related accepted procedures. This is an incomplete system intended to provide the functions identified in, and when installed according to this installation manual.

10.1.1. System Function

AV-Link and AV-30-C, when paired with an ADS-B receiver, can display traffic information. This information is supplemental and for advisory use only. It cannot replace required equipment.

10.1.2. FCC ID

The AV-Link contains FCC ID 2AC7Z-ESPWROOM02U.

10.1.3. AV-Link Specifications

The AV-Link Specifications are as follows:

Characteristics	Specifications
Part Number	UAV-1004414-001
Width	52.06 mm
Height	25.91 mm
Depth	52.63 mm
Weight	1.1 oz (32.2 grams)
Operating temperature range	-45°C to +70°C
Maximum pressure altitude	35,000 ft
Input voltage range	9 to 30.3 VDC
14V current	0.02A idle 0.025A typical 0.05A maximum

28V current	0.01A idle 0.0125A typical 0.025A maximum
-------------	---

Table 12: AV-Link Specifications

Figure 18: AV-Link Mechanical Drawing

10.1.4. AV-Link Software

The software contained in the AV-Link device is identified by electronic marking. Software version information can be accessed via an embedded web page.

10.1.5. AV-Link Installation Materials and Tools

AV-Link installation requires access to these tools:

- Flat Screwdriver
- 3/16" Nut Driver

10.1.6. Additional Required Equipment

AV-Link is designed to interface with an existing AV-30-C display. To take advantage of AV-Link the following equipment is required:

- AV-30-C 3-1/8" Display

10.1.7. Mounting

Option 1: If the installation does not include an AV-HSI, the AV-Link is mounted in series between the AV-30-C and the AV-30-C backshell connector.

Option 2: If the installation includes an AV-HSI, it is recommended to attach the AV-Link directly to the AV-HSI to facilitate data sharing and a single access point for software update. Refer to *AV-HSI Installation Overview* Section 10.5.3 for details.

10.1.8. Removing AV-30-C From Instrument Panel (Optional)

It may be necessary, because of space limitations, to remove the AV-30-C unit for performing AV-Link installation. Using a Phillips screwdriver, remove the four [4] screws that attach the AV-30-C to the aircraft instrument panel. Pull unit down to a workable position. Note that it may also be necessary to disconnect the Pitot and Static lines to bring it into reach. Ensure that the lines are properly labeled before disconnecting.

10.1.9. AV-30-C Backshell Connector Removal

Using a flat screwdriver, loosen the two [2] screws that hold the backshell connector to the DB-15 connector on the back of the AV-30-C until the backshell connector is free to detach from the AV-30-C. If present, leave the bonding/ground strap attached to the backshell connector.

Figure 19: AV-Link Backshell Connector Removal

10.1.10. AV-Link Attachment to AV-30-C

Do not attempt to remove the two [2] captive Jack Screws from the AV-Link housing. Attach AV-Link to the back of the AV-30-C by inserting the unit into the DB-15 connector on the back of the AV-30-C.

Figure 20: AV-Link Attachment

Do not push against the Jack Screws as they will stop against the screw bosses on the AV-30-C connector preventing proper seating of AV-Link. Also, make sure to seat AV-Link completely before tightening the Jack Screws. Do not attempt to use the Jack Screws to pull AV-Link into the AV-30-C connector. AV-Link should seat firmly into the AV-30-C as shown in Figure 21.

Figure 21: AV-Link Installed

Using a 3/16" nut driver, tighten the two [2] Jack Screws to 5 in-lbs. maximum. **DO NOT OVERTIGHTEN.**

Reattach the original AV-30-C Backshell Connector. Using a flat screwdriver, tighten the two [2] screws to 5 in-lbs. maximum. **DO NOT OVERTIGHTEN.**

Figure 22: AV-Link attachment with backshell

10.1.11. AV-30-C Reinstallation in Instrument Panel

If the AV-30-C was removed from the aircraft instrument panel, reinstall the unit. If the original screws have been misplaced, please observe Section 9.6.

10.1.12. AV-30-C Configuration

In the AV-30-C installation menu, set SERIAL 3 to AV-LINK. See Section 12 for guidance on accessing the Installation Menu.

10.1.13. System Limitations

AV-Link is designed to supplement an AV-30-C. System limitations for AV-Link are determined by AV-30-C limitations.

10.1.14. Connecting to the AV-Link via Wi-Fi

As shipped from the factory, the AV-Link will function in default mode. However, to protect your AV-Link from unauthorized access and comply with SAIL A-1502, password protection must be enabled on the AV-Link's Wi-Fi network. To enable a password, change AV-Link settings, or apply firmware updates, the AV-Link may be accessed through a web browser, as described below.

Windows, MacOS, iOS and other devices are supported using the built-in web browser on your computer. To connect to the AV-Link through your browser, configure your computer for the AV-Link Wi-Fi connection.

- 1) Power AV-Link by attaching the AV-Link to AV-30-C to provide power.

- 2) Once the AV-Link is powered, on your computer, connect to the AV-Link Wi-Fi hotspot, which will have an "AV_XXXX" SSID, where XXXX is a combination of alpha-numeric characters.

- 3) Once connected, use your web browser to navigate to 192.168.5.1 to view AV-Link settings.

- 4) To set a password, select the Password box under "Wi-Fi Settings" and enter a combination of at least 8 letters,

numbers, or symbols. Click Save. Record the password in your aircraft logbook.

The image shows a web-based configuration interface for an AV-Link device. At the top, there is a decorative header with a stylized aircraft icon and the text "AV-LINK". Below this, there are two main settings sections. The first section is titled "Wi-Fi Settings" and contains fields for SSID (set to "AV_BC7D"), Password (masked with dots), Power Level (set to 9), and a checked "Broadcast" checkbox. The second section is titled "ADS-B Receiver Settings" and contains fields for SSID (a dropdown menu), Password (masked with dots), Port (set to 4000), and a checked "Auto Connect" checkbox. The status of the ADS-B receiver is shown as "Waiting". At the bottom of the interface are three buttons: "Save" (green), "Cancel" (gray), and "Defaults" (gray).

Wi-Fi Settings	
SSID	AV_BC7D ☒ Broadcast
Password	
Power Level	9 ▼

ADS-B Receiver Settings	
SSID	▼ ☒ Auto Connect
Password	
Port	4000
Status	Waiting

- 5) If the password was changed in the previous step, reconnect to the AV-Link's Wi-Fi network with the new password. Note that on some devices, the network SSID may appear with a number appended to it after adding a password.

Refer to Section 10.1.16 to reset the password or other settings.

10.1.15. Wi-Fi Firmware Update Page

All settings changes should be performed while on the ground. Accessing the AV-Link web pages while in flight is not recommended and may disrupt normal operations of AV-30-C and AV-Link.

The AV-Link firmware update page permits firmware updating of AV-Link. Refer to the most recent service bulletin for the latest firmware update instructions.

10.1.16. AV-Link Factory Reset

The AV-Link can be returned to factory settings from the AV-30-C installation menu. For example, if the WiFi password was set but forgotten, the factory reset will delete the password. AV-Link software version 0.2.39 or later is required to support factory reset.

To execute factory reset, go to the AV-30-C installation menu item named "RESET AVLINK", select YES, then press and hold the right button until "COMPLETE" appears.

After completing the reset, a new WiFi password must be set using the steps detailed in Section 10.1.14.

10.1.17. Optional AV-Link Connected to AV-HSI

Starting with AV-30-C Software release 3.0.1, a single AV-Link can be connected directly to an AV-HSI. In this configuration, the single AV-Link provides the traffic and carbon monoxide monitoring to every AV-30-C connected to the AV-HSI. Additionally, the single AV-Link can be used to update the AV-HSI or any connected AV-30-C.

To use this configuration, attach the AV-Link directly to the AV-HSI and connect the AV-HSI's DB15 connector to the other side of the AV-Link. Configure the AV-30-C as follows:

- 1) In the AV-30-C Installation Menu, navigate to AVHSI CFG and press the center knob to select.

- 2) Navigate to SERIAL 4.
- 3) If there is an AV-30-C connected to AV-HSI SERIAL 4 (pins 8 and 15), set SERIAL 4 to AVL+AV30. Otherwise set to AV-LINK.

- 4) Connect a PC or tablet to the AV-LINK Wi-Fi connection following the steps in Section 10.1.14
- 5) Select "Wi-Fi Settings" in the bottom left corner.

[Wi-Fi Settings](#) [Statistics](#) [AV Display
Software Update](#) [AV-HSI
Update](#)

- 6) In the AV-HSI Settings section, specify if the AV-Link is connected to an AV-HSI with or without an AV-30-C connected to SERIAL 4 (pins 8 and 15).

The screenshot shows a web browser window with the address bar displaying "http://192.168.5.1/settings". The page features a stylized logo at the top and three main settings sections:

- Wi-Fi Settings:** Includes fields for SSID (AV_D7D5), Password, and Power Level (9). A "Broadcast" checkbox is checked.
- ADS-B Receiver Settings:** Includes fields for SSID (dropdown), Password, Port (4000), and Status (Waiting). An "Auto Connect" checkbox is checked.
- AV-HSI Settings:** Includes a "Connected Devices" dropdown menu. The dropdown is open, showing options: "None", "AV-HSI without AV-30 on COM4", and "AV-HSI with AV-30 on COM4".

At the bottom, there are buttons for "Save", "Cancel", and "Defaults".

- 7) Click Save. Power cycle the AV-30-C, AV-HSI, and AV-Link
- 8) If multiple AV-30-C are connected to the AV-HSI, each one can be identified by matching the DEVICE ID in the AV-30-C installation menu with the device number on the AV-Link web page.

10.2. Transponder (tailBeaconX or echoESX)

NOTICE

For complete installation guidance, see *tailBeaconX TSO User and Installation Guide UAV-1004270-001*, *UAV-1004270-001* and *tailBeaconX STC Installation Manual UAV-1003599-001*.

For operation of tailBeaconX or echoESX using the AV-30-C, see *AV-30-C Pilot's Guide UAV-1003946-001*.

tailBeaconX or echoESX are complete Mode S Extended Squitter (ES) ADS-B OUT transponders integrated with an internal SBAS/WAAS GPS and all necessary antennas into an LED rear position light. They are designed to meet the transponder and ADS-B requirements for operating in controlled airspace worldwide, while minimizing installation costs.

These transponders can optionally provide GPS information to the AV-30-C, including magnetic track and groundspeed.

For parallel connection of a tailBeaconX or echoESX to two AV-30-Cs, connect and configure the AV-30-Cs according to Figure 36. Note that the either transponder will only output GPS data when controlled by an AV-30-C. As diagrammed in Figure 36, the top AV-30-C will only receive GPS data if the bottom AV-30-C is powered on and configured properly.

Figure 36: Parallel tailBeaconX or echoESX GPS Connections

10.2.1. Transponder Control

Transponder controls are enabled by selecting "BEACON X" on the "SERIAL 2" installation menu. See *AV-30-C Pilot's Guide UAV-1003946-001* for transponder control information.

10.2.2. Transponder Testing with AV-30-C

Ground test mode may be initiated from the AV-30-C via the following:

- Open the AV-30-C installation menu and select BEACONX GTM
- The transponder will now respond to All-Calls on transponder test sets.
- When test is complete, cycle transponder power.

10.2.3. Transponder Configuration

A newly installed tailBeaconX or echoESX transponder can be configured with the AV-30-C. Use the installation menu option "BEACONX CFG" to configure the transponder. The configuration options are split into basic and advanced groups.

Basic:

- Call Sign/Tail Number
- ICAO Code
- V-MAX (Maximum aircraft speed)
- VS0 (Stall Speed)
- ADSB-IN Capability

Advanced (optional):

- Emitter Type (Light, Rotorcraft, etc)
- Size Code (Length + Width)
- Default Squawk
- GPS Antenna Lateral Offset
- GPS Antenna Longitudinal Offset

Note: this configuration capability is similar to that provided by the skyBeacon smart phone application with the exception of WiFi setup.

10.3. AV-Mag External Magnetometer

10.3.1. Magnetometer Overview

AV-Mag external magnetometer (P/N UAV-1006518-001) is a 3-axis electronic compass. It can precisely measure the earth's magnetic

field and aid the AV-30-C gyroscopic heading measurement, improving long-term accuracy.

The AV-Mag improves accuracy of the gyroscopic direction indication of the AV-30-C. It is not a certified replacement for a required wet or dry compass.

For the AV-Mag to be effective, the installation and calibration must be done with accuracy and precision.

10.3.2. System Function

The AV-Mag, when paired with an AV-30-C, can provide consistent and accurate heading. The AV-Mag is an aiding device and does not provide full slaving to the AV-30-C.

10.3.3. AV-Mag Specifications

The AV-Mag dimensions and pinout are as follows:

Characteristics	Specifications
Part Number	UAV-1006518-001
Width	1.49 Inches
Height	0.67 Inches
Depth	2.38 Inches
Weight	1.4 oz (40.0 grams)
Operating temperature range	-40°C to +70°C
Maximum pressure altitude	35,000 ft
Input voltage range	6-12 VDC; 7V typical (from AV-30-C auxiliary power output)
Current (@ 7V)	12 mA typical

Table 13: AV-Mag Specifications

Figure 37: AV-Mag Mechanical Drawing

Wire	Function	AV-30-C Pin
Red	+7 VDC Power	13
Black	Ground	10
Brown	Tx Data (AV-Mag → AV-30-C)	6
Green	Reserved serial input	NC
Blue	Reserved serial output	NC
White	Reserved serial input	NC

Table 14: AV-Mag Wiring Guide

10.3.4. AV-Mag Software

The software contained in the AV-Mag device is identified by electronic marking. Software identification information is sent in a serial message after power-up. The software part number and software version can be verified via the installation menu of the AV-30-C (Table 43). The first screen of the AV-Mag installation menu

also shows the current AV-Mag software version and CRC (see Section 10.3.8). If AV-Mag is not properly connected, the version will indicate 'N/A' or 'Not detected'.

10.3.5. AV-Mag Installation Overview

An overview of the installation process is provided below. Detailed instructions are later in this section.

Step	Action	Verification
Connect and configure	Red wire → pin13 Black wire → pin 10 Brown wire → pin 6 SERIAL4 → AVMAG (*Dual AV-30-C parallel AV-Mag wiring shown in Section 19)	Red "NO MAG" flag indicates a bad connection Red "MAG CAL" flag indicates the connection is good and calibration is needed
Locate and mount	Set the AV-Mag mounting orientation in the AV-30-C Interference check < 10%	N/A
Calibrate	AVMAG CAL operation On ground, 12-heading measurement	Red "MAG CAL" flag disappears Verify heading on ground
Record	Orient the aircraft to the 12 headings used in calibration	Record the results

Quick Installation Instructions

1) Wire and position the AV-Mag

- a. Identify a potential mounting location in the tail or wings.
- b. Run wires from the AV-30-C to the mounting location and connect to the AV-Mag.

2) Configure the AV-30-C

- a. In the AV-30-C installation menu, set SERIAL 4 to AVMAG to enable the AV-Mag.
- b. Enter the AV-Mag installation sub-menu (AVMAG INSTL) found in the AV-30-C installation menu.
- c. Check the mounting location for magnetic interference using the interference monitor in the AVMAG INSTL menu.
 - i. If magnetic interference is excessive at the mounting location, select a different mounting location.

- d. Mount and align the AV-Mag using brass screws.
- e. Enter the orientation of the AV-Mag according to Table 16.
- f. Adjust AV-Mag mounting angles to match AV-30-C mounting angles as displayed on the AV-30-C.
 - i. If necessary, build a bracket for the AV-Mag for mounting in the correct orientation and alignment.
 - ii. AV-Mags can report their own roll and pitch angles to the AV-30-C. Those angles are visible on the second to last screen of the AV-Mag installation.

3) Perform AV-Mag Calibration

- a. Run a calibration procedure on the installed AV-Mag and AV-30-C.
- b. Perform a final check of heading. If all headings are off by a constant amount, use the DG adjustment to compensate.

Record your work on the provided tables and aircraft logbook.

10.3.6. AV-Mag Installation Materials and Tools

AV-Mag installation requires access to these tools:

- Non-magnetic Screwdriver and wrench
- Fish tape for pulling wire from cockpit through wing structures
- Drill and drill bit
- Brass fasteners
- (Optional) Non-magnetic digital level or digital protractor/angle gauge. For example: Johnson Level & Tool 1886-0000 Magnetic Digital Angle Locator (unscrew the back of the case to remove the built-in magnets)

10.3.7. Additional Required Equipment

AV-Mag is designed to interface with an existing AV-30-C display.

10.3.8. Enable the AV-Mag

Use of the AV-Mag is enabled through the AV-30-C installation menu.

Before applying power, push and hold the center rotary knob and apply power. As the AV-30-C splash screen appears, check that a

minimum version of 2.3.9 is displayed. AV-Mag support is not available in software versions prior to 2.3.9.

Enter the AV-30-C installation menu and navigate to the serial 4 interface option (SERIAL 4). Set SERIAL 4 to AVMAG.

While SERIAL 4 is set to AVMAG, the AHRS aiding mode (AID MODE) will automatically be set to AVMAG and cannot be changed.

Enter the AV-30-C installation menu again and navigate to the AV-Mag installation menu (AVMAG INSTL). Push the center rotary knob, then press the right button to begin the installation process. If AV-Mag is not properly connected, the version will indicate 'Not detected'.

10.3.9. AV-Mag Installation Location and Interference Monitor

Identify a mounting location on the aircraft. Suitable mounting locations include the tail and either wing. The cockpit is an unsuitable mounting location for the AV-Mag.

Proximity to ferrous materials and current-generated magnetic fields can negatively affect AV-Mag performance. Avionics, engines, wing spars, pitot heaters, lights, etc. are all potential sources of interference. Any interference which varies during flight may generate erroneous headings from the AV-Mag. Because of this, the installation location should be as far as practical from these types of interferers. Inspect existing wiring near the installation location and repair or refresh any deteriorated insulation or corroded connections. Because wire loops generate magnetic fields, avoid locations near wires forming physical loops.

The fourth screen of the AVMAG INSTL menu is a magnetic field interference monitor with a checklist of aircraft systems which may be sources of interference.

Use the rotary knob to step through each system in the checklist and monitor the magnetic field deviation value.

The deviation value indicates the magnitude and direction of the magnetic reading with respect to the Earth's magnetic field. A relatively small deviation near zero indicates little or no magnetic field interference, while a larger negative or positive deviation indicates the AV-Mag is sensing magnetic fields in addition to the Earth's. These additional fields must be minimized in order for the AV-Mag to be accurate.

At the end of the checklist, a REVIEW screen identifies which systems caused the largest deviations. Identifying systems that cause interference, especially those that generate temporary magnetic fields, can aid in proper site selection for installing the AV-Mag. The interference range indicates fluctuating magnetic fields which will negatively impact calculated magnetic heading values, so a good installation requires this range to be as small as possible. If the range is greater than 10%, attempts should be made to re-site the AV-Mag location or to mitigate interferers.

10.3.10. AV-Mag Installation Orientation and Attitude

The AV-Mag can be installed in several orientations. The chosen installation orientation must be entered into the fifth page of the AVMAG INSTL menu according to Table 16. Figure 45 depicts the label and wire directions referenced in the table.

The AV-Mag uses an internal sensor to detect which orientations are possible and indicates them on screen. The selected orientation should be one of those self-detected options.

Menu Option	Label Direction	Wire Direction
LUP+WAFT	Upward (facing up)	Toward tail (wires aft)
LUP+WFOR	Upward	Toward nose (wires fore)
LUP+WLT	Upward	Toward left wingtip (wires port)
LUP+WRT	Upward	Toward right wingtip (wires starboard)
LDN+WAFT	Downward (facing down)	Toward tail
LDN+WFOR	Downward	Toward nose
LDN+WLT	Downward	Toward left wingtip
LDN+WRT	Downward	Toward right wingtip
LRT+WAFT	Right wingtip (facing starboard)	Toward tail
LRT+WFOR	Right wingtip	Toward nose
LRT+WUP	Right wingtip	Toward sky (wires upward)
LRT+WDN	Right wingtip	Toward ground (wires downward)
LLT+WAFT	Left wingtip (facing port)	Toward tail
LLT+WFOR	Left wingtip	Toward nose
LLT+WUP	Left wingtip	Toward sky
LLT+WDN	Left wingtip	Toward ground
LFOR+WUP	Forward (facing nose)	Toward sky
LFOR+WDN	Forward	Toward ground
LFOR+WLT	Forward	Toward left wingtip
LFOR+WRT	Forward	Toward right wingtip
LAFT+WUP	Aft (facing tail)	Toward sky
LAFT+WDN	Aft	Toward ground
LAFT+WLT	Aft	Toward left wingtip
LAFT+WRT	Aft	Toward right wingtip

Table 16: AV-Mag Orientation Options

Figure 46: AV-Mag Orientation Reference

In addition to the installation orientation, the mounting attitude of the AV-Mag must be determined as well. Though a small amount of angular mismatch between the installation attitudes of the AV-Mag and AV-30-C is tolerable, the AV-Mag is ideally installed with the same roll, pitch, and yaw as the AV-30-C.

To match angles of the two devices, reference the fourth page of the AVMAG INSTL menu, which displays the roll and pitch angles of the AV-30-C as mounted in the aircraft.

Adjust the AV-Mag mounting attitude to match that of the AV-30-C as closely as possible. Simultaneously, the AV-Mag should be oriented as parallel to the line of flight as possible.

The AV-30-C automatically measures the roll and pitch angles of the AV-Mag. Those angles are displayed on the SAVE screen. The AV-30-C will calculate the differences between AV-30-C and AV-Mag mounting angles for use in the heading solution.

After angles have been saved, calibration may begin. Record the installation selections and parameters in Table 51.

10.3.11. AV-Mag Calibration

Calibration is the process of detecting and compensating for minor magnetic field and ferrous material interferences coming from the aircraft. If the AV-Mag is relocated or is removed and reinstalled, a re-calibration must be performed. AV-Mag orientation, roll and pitch installation angles, must be up to date at the time of calibration.

When calibration needs to be performed, in the absence of other flags, a red flag (MAG CAL) will appear.

Figure 52: MAG CAL Flag and AVMAG CAL Selection

Prior to calibration, complete all installation and measurement steps from Section 10.3.10. Failure to complete all installation steps will result in an invalid calibration.

The calibration menu appears as AVMAG CAL in the AV-30-C installation menu. The calibration process requires the aircraft with AV-30-C and AV-Mag installed to be oriented to each of 12 headings, with a 10 second measurement time at each orientation. Any

interfering systems that must be on during flight (e.g., navigation lights) must also be on during calibration.

When AV-Mag is connected in parallel to multiple AV-30-C, calibration must be completed on each connected AV-30-C. Simultaneous calibration is recommended.

- 1) The external magnetometer calibration feature is found in the install menu. Hold down the center button while applying power. The installation menu can now be accessed until the next power cycle.
- 2) Move the aircraft to a location that is as level as possible and is far from power lines, metal structures, or reinforcement steel underground or nearby.
- 3) Enter the INSTALL menu and select AVMAG CAL, then press CALIB. Note that on units without an external magnetometer, AVMAG CAL will be disabled.

Figure 53: AV-Mag Calibration Entry

NOTICE

The aircraft will need to be oriented to twelve headings, each separated by 30 degrees. Calibration is sensitive to the angle between each of the heading orientations; if an accurate airfield compass rose is not available, measurements for each turn can be obtained using a calibrated magnetic compass or an electro-mechanical gyro. The AV-30-C will also provide an on-screen turning guide to each calibration point.

- 4) Follow the on-screen instructions, pressing the right button once the aircraft is oriented to heading 360. Keep the aircraft as motionless as possible while the "Calibration in progress" message is displayed.

Figure 54: AVMAG CAL In-Progress

- 5) Repeat step 4 for each orientation as directed by the on-screen instructions. The bottom-center display indicates the degrees and direction to the next orientation and will turn green when the aircraft is oriented correctly.

Figure 56: AVMAG CAL Orientation Guide

- 6) Upon completion, the raw data will be processed. If a good calibration is possible, the red MAG CAL flag will extinguish, and the screen shall display a success message. If the calibration failed, please review the procedure and execute it again.

Figure 57: AVMAG CAL Success and Failure Screens

The AV-30-C will retain all magnetometer calibration data even if a hard reset is executed. Internal magnetometer and external magnetometer calibration data are stored independently.

Parameter	Value
Installation Location on Aircraft	
AV-Mag Orientation	
Interference Range	
Max Interferer	
Min Interferer	
AV-30-C Roll Angle	
AV-30-C Pitch Angle	
AV-Mag Roll Angle	
AV-Mag Pitch Angle	
AV-Mag Yaw Angle (post-calibration)	

10.3.12. AV-Mag Yaw Angle

Please complete calibration of the AV-Mag prior to following the instructions of this section. Upon completion of calibration, the displayed heading at each of the 12 orientations should be checked and recorded in Table 52.

If every heading is off by the same value, then the alignment of the aircraft to magnetic north may be imperfect. It is also possible that yaw angle of the installed AV-Mag may be imperfectly aligned with the aircraft line of flight.

Generally, the DG adjustment should be used to compensate for a constant heading offset and the AV-Mag Yaw Angle setting should be left at 0.0. If required, uAvionix technical support may direct you to change the Yaw Angle value.

10.4. Autopilot Overview

The AV-30-C can provide heading and course guidance to select analog autopilots using the AV-APA accessory or digital ARINC 429 autopilots using the AV-HSI accessory.

Both interfaces allow the heading bug from the AV-30-C to drive the autopilot heading mode. The AV-APA allows several GPS-based lateral navigation modes and the AV-HSI enables vertical guidance to select autopilots.

The Advanced Autopilot Software Unlock enables GPS Steering (GPSS) to autopilots connected through either the AV-APA or AV-HSI. Additionally, with an AV-Link and the Advanced Autopilot Unlock, the autopilot may be coupled to ForeFlight flight plans.

NOTICE

To provide the most accurate heading information for autopilot heading hold mode, it is required that the AV-Mag be used in conjunction with the any connected autopilot.

Below are descriptions of each interface. See the *AV-30-C Pilot's Guide UAV-1003946-001* for autopilot operation instructions.

10.4.1. AV-APA Analog Port Adapter

10.4.1.1. AV-APA Overview

The AV-APA emulates the analog heading signal used by legacy autopilots to provide basic heading hold as well as several directional control modes derived from GPS data.

To provide the most accurate heading information for heading hold mode, it is required that the AV-MAG be used in conjunction with the AV-APA.

The AV-APA currently supports the following autopilots:

Manufacturer	Model
S-TEC / Genesys Aerosystems	System 20
	System 30
	System 40
	System 50
	System 55/55X
	System 60-1/60-2/65

Table 18: Supported Autopilots

When configured to connect to an S-TEC autopilot, the AV-APA emulates the Bendix King KI-525A/KCS 55A heading output, as described in *Bendix King 006-15621-0007 Rev 7*.

If replacing a heading system other than the KCS 55A, the autopilot will need to be configured to accept KCS 55A signals. This involves changing programming resistors within the S-TEC control head. See an S-TEC authorized maintenance provider for details.

Other autopilots that are compatible with the KI-525A may also be used.

10.4.1.2. AV-APA Specifications

Characteristics	Specifications
Part Number	UAV-1007840-001
Width	2.2 Inches
Height	0.8 Inches
Depth	2.6 Inches
Weight	1.7 oz (48 grams)
Operating temperature range	-40°C to +70°C
Input voltage range	+10 to +32 VDC
14V current	.024 A typical
28V Current	.012 A typical

Table 19: AV-APA Specifications

Table 21: AV-APA Pinout

10.4.1.3. AV-APA Installation Overview

An overview of the installation process is provided below. Further details for the process may be found later in this document.

- 1) Configure the AV-30-C.
 - a. In the AV-30-C installation menu, set SERIAL 2 to AV-APA to enable AV-APA functionality in the AV-30-C.
 - b. In the AV-30-C installation menu, set the appropriate autopilot type under the 'AV-APA CFG' option.
 - c. If using the serial pass-through capability of the AV-APA, select the connected device in the 'AV-APA THRU' option.
- 2) Wire and mount the AV-APA.
 - a. Identify the mounting location.
 - The AV-APA should be mounted to something rigid in a location that does not interfere with flight control movement.

- The AV-APA is not waterproof; it must be mounted in a dry location.
 - b. Wire the AV-APA to the AV-30-C and autopilot as described below. Detailed information about your autopilot can be found in your autopilot's installation manual.
 - c. Mount the AV-APA using appropriate fasteners. Fastener length and type will vary by installation and are therefore not provided in the installation kit. Use AC 43.13-1B for guidance.
- 3) Perform a ground check out.
- a. Perform a ground checkout as described below and as described in your autopilot installation manual.

10.4.1.4. AV-APA Installation Materials and Tools

AV-APA installation kit includes the following components:

- One 9-pin D-Sub socket connector and shell
- One 9-pin D-Sub pin connector and shell
- M39029/63-368 sockets
- M39029/64-369 pins
- Ring terminals for shield termination

The following additional components will be required:

- Two conductor shielded wire, 22 or 24-gauge, M27500-22TG2T14 or M27500-24TG2T14
- Single conductor power and ground wire, 22 or 24-gauge, MIL-W-22759/16 or equivalent
- Pins for the autopilot connector. See autopilot installation manual for specification
- #8 fasteners appropriate to mount AV-APA to airframe

The AV-APA installation kit includes machined pins. These pins should be crimped with a Daniels AFM8 crimp tool using a K13-1 positioner, or equivalent M22520/2-01 crimp tool.

10.4.1.5. Configure the AV-30-C for the AV-APA

Use of the AV-APA is enabled through the AV-30-C installation menu.

Before applying power, push and hold the center rotary knob and apply power. As the AV-30-C splash screen appears, check that a

minimum version of 3.0.1 is displayed. AV-APA use is not approved on units with software versions prior to 3.0.1.

Enter the AV-30-C installation menu and navigate to the serial 2 interface option (SERIAL 2). Set SERIAL 2 to AV-APA.

Navigate to AV-APA configuration option (AV-APA CFG) and select the appropriate autopilot that will be connected.

If connecting a device to the AV-APA pass-through port, navigate to the AV-APA passthrough option (AV-APA THRU) and select the appropriate device that is connected.

Press the left (DONE) button to exit the installation menu.

If using GPS Steering provided by the Advanced Autopilot Software Unlock, the GPSS gain can be adjusted to tune autopilot performance. The default is 1.0. Adjusting the gain upward by small increments will make the autopilot turn more aggressively. Adjust the gain downward for more shallow turns.

10.4.1.6. AV-APA Wiring and Autopilot Configuration

The AV-APA analog output emulates the heading output of the Bendix King KI-525A HSI within the KCS-55A system.

Ensure that your S-TEC control head (or GPSS module, if equipped) is configured to use the KCS-55A. This will be stamped on a label on the autopilot control head or GPSS module.

If your autopilot system is not configured to accept the KING KCS 55A input, see an authorized S-TEC dealer for modification.

Once confirming that the autopilot is configured correctly, use the following wiring diagrams to build a harness:

NOTES:

1. THE AV-APA MAY SHARE A 2A CIRCUIT BREAKER WITH AN AV-30.
2. USE 22 OR 24 AWG MIL-C-27500 WIRE.
3. WIRE SHIELD SHOULD BE TERMINATED TO THE D-SUB MOUNTING SCREW.

Figure 67: AV-APA – AV-30-C Interconnect Drawing

NOTES:

1. USE 22 OR 24 AWG MIL-C-27500 WIRE.
2. CONNECT TO GPSS CONVERTER IF PRESENT, AUTOPILOT COMPUTER IF GPSS CONVERTER IS NOT PRESENT. DO NOT CONNECT TO BOTH.
3. HDG AND CRS DATUMS SIMULATES A KI-525A HSI. IF REPLACING HEADING REFERENCE OTHER THAN KI-525A THEN THE AUTOPILOT NEEDS TO BE MODIFIED TO ACCEPT KI-525A SIGNALS. SEE S-TEC REFERENCE MATERIAL.
4. SEE S-TEC DOCUMENTATION FOR INTEGRATION INFORMATION AND CHECKOUT PROCEDURES.
5. COURSE (CRS) DATUM OUTPUT IS ONLY AVAILABLE IF INSTALLED WITH AN AV-HSI.
6. CONNECT PIN 6 IN PARALLEL TO BOTH CRS AND HDG INPUTS IF PRESENT

Figure 68: AV-APA – S-TEC Interconnect

Ground wire shields to AV-APA connector backshells as depicted in Figure 15 and Figure 16. Secure harness to the AV-APA using the included screws.

10.4.1.7. Ground Checkout

See checkout guidance in Section 12.2.10.

10.4.2. ARINC 429 Autopilots

The AV-HSI outputs ARINC 429 data as defined by the *General Aviation Manufacturers' Association (GAMA) Publication No. 11, ARINC 429 General Aviation Subset, Version 6.0*. This data can be used to interface the AV-HSI with the Bendix King AeroCruze 100/ TruTrak Vizion PMA or the Trio Pro Pilot autopilot.

NOTICE

For complete AeroCruze installation guidance, see *Installation Guide for Vizion PMA*. Aerocruze software version PV.40 is required. Refer to *xCruze 100 Autopilot Installation Manual 8300-086 Rev B*

For complete Trio Pro Pilot installation guidance, see the *Trio Avionics Pro Pilot Manual*. Trio software 220322F or later and the Trio Autopilot EFIS Unlock are required.

The AV-HSI sends selected heading, selected course, and set altitude to the autopilot. Additionally, if a connected AV-30-C has the Advanced Autopilot Unlock, the AV-HSI can forward GPS Steering commands from a panel mounted navigator to the autopilot, negating the need for an external ARINC 429 switch.

When using the ARINC 429 interface, vertical speed is set directly on the autopilot.

10.4.2.1. ARINC 429 Autopilot Installation

To interface the AV-HSI and AV-30-C with an ARINC 429 autopilot, the ARINC 429 TX lines out of the AV-HSI are spliced to go to both the autopilot and the GPS navigator.

Autopilot wiring with the Advanced Autopilot Unlock is as follows:

NOTES:

1. USE 22 OR 24 AWG MIL-C-27500 TWO CONDUCTOR SHIELDED WIRE.
2. SPLICE A429 TX A AND B TO CONNECT TO BOTH AUTOPILOT AND GPS NAVIGATOR, REFER TO FIGURE AV-HSI - ARINC 429 INTERCONNECT DRAWING FOR DETAILS

Figure 69: AV-HSI – ARINC 429 Autopilot Interconnect With Advanced AP Unlock

When not using the Advanced Autopilot Unlock, a DPDT switch is wired to select between GPS and AV-30-C control of the autopilot. This wiring is as follows:

NOTES:

1. USE 22 OR 24 AWG MIL-C-27500 TWO CONDUCTOR SHIELDED WIRE.
2. SPLICE A429 TX A AND B TO CONNECT TO BOTH AUTOPILOT SWITCH AND GPS NAVIGATOR INPUT, REFER TO FIGURE AV-HSI - ARINC 429 INTERCONNECT DRAWING FOR DETAILS.
3. SPLICE A429 RX1 A AND B TO CONNECT TO BOTH GPS OUTPUT AND AUTOPILOT SWITCH.

Figure 70: AV-HSI – ARINC 429 Autopilot Interconnect Without Advanced AP Unlock

Refer to your autopilot installation manual for configuration details.
Recommended settings are:

Trio ProPilot	
In AV-30-C AV-HSI Config: AP Type	1
Trio Autopilot Software version 220322F or later and the Trio EFIS Software Unlock are required	

Bendix King Aerocruze	
On Autopilot: EFIS Type	2 (See AeroCruze Installation Manual Lateral Settings for configuration instructions)
In AV-30-C AV-HSI Config: AP Type	2
Aerocruze Software PV.40 or later is required	

Perform ground checkout per your autopilot's installation manual.

10.4.3. Advanced Autopilot Unlock

With the optional Advanced Autopilot Unlock, the AV-30-C and AV-HSI can process GPS Steering (GPSS) messages from a panel mounted navigator. This processing enables the following, based on your autopilot interface:

Autopilot Interface	Capability Unlocked
AV-APA	Legacy analog autopilot connected to the AV-APA can follow GPS course from a panel-mounted navigator.
ARINC 429 through AV-HSI	AV-HSI forwards lateral and vertical GPS steering messages from the GPS out to connected autopilots, negating the need for an external ARINC 429 switch.

The Advanced Software Unlock is performed by navigating to the "Advanced AP" option in the AV-30-C installation menu.

When this option is selected, a QR code is presented. Use your mobile phone or tablet camera application to take a picture of the QR code and open the unlock website. From there, the unlock code can be purchased.

Once purchased, the unlock website will present an 8 character unlock code. This code is entered into the AV-30-C by rotating the center knob to change the digit and pressing the center knob to advance to the next digit. Once the code is successfully entered, press the center knob again to validate. If the code validates correctly, the QR code will be removed, and the feature will be unlocked.

If using in an installation with multiple AV-30-C, only the AV-30-C connected to the AV-APA needs the Advanced AP Unlock. If using in an installation with the AV-HSI, only one AV-30-C needs the unlock.

For safety, the QR code will not be presented if the AV-30-C is indicating an airspeed or if the gyros are aligning.

10.5. HSI Horizontal Situation Indicator

10.5.1. AV-HSI Overview

The AV-HSI enables course and glideslope guidance display on multiple connected AV-30-C to enable GPS and ILS precision instrument approaches and enroute guidance.

The AV-HSI adds three ARINC 429 channels (2 receive, 1 transmit) to interface with most panel-mounted GPS navigators. In addition, the AV-HSI includes four serial ports that act as a hub between multiple AV-30-C as well as supporting portable GPS and serial VOR/ILS devices. The hub capability forwards navigation guidance to all connected AV-30-C as well as synchronization of barometric pressure setting, heading bug, OAT, autopilot mode, and more as listed in Table 42. If an AV-Link is connected directly to the AV-HSI, this hub function also serves traffic, carbon monoxide alerts, and software updates from the AV-Link to all connected AV-30-C.

The AV-HSI may be connected to one GPS navigation source and one VHF navigation source, whether from one combined GPS nav/com unit or from a standalone GPS navigator and VHF navigator. If the installer wishes to connect to multiple GPS navigators, multiple AV-HSI and independent AV-30-C are required. This creates a fully redundant system.

NOTICE

Due to the precise nature of IFR navigation, the AV-Mag is required when using the AV-HSI.

The AV-HSI is compatible with the following GPS Navigators:

Manufacturer	Model
Avidyne	IFD 410/440
	IFD 510/540/545/550
Garmin	GPS 155XL/300XL
	GPS 400(w)/GNC 420(w)/ GNS 430(w)
	GNS 480/CNX80
	GPS 500(w)/GNS 530(w)
	GTN 625(xi)/635(xi)/650(xi)
	GTN 725(xi)/750(xi)
	GPS 175/GNC 355/GNX 375
Various	Portable NMEA GPS (Examples include Aera 660, GPSMAP 296/396/496). Note: these provide VFR-only guidance.

Table 25: AV-HSI Compatible GPS Navigators

The AV-HSI is compatible with the following NAV/COMM or VOR/ILS Receivers:

Manufacturer	Model
Avidyne	IFD 440
	IFD 540/550
Garmin	GNS 430(w)/530(w)
	GNS 480/CNX80
	GTN 650(xi)/750(xi)
	GNC 215
	GNC 255
	Garmin/Apollo SL30
Trig	TX56(a)/TX57(a)
MGL	N16 (requires separate control head)
VAL	NAV 2000

Table 26: AV-HSI Compatible NAV/COMM

The AV-HSI implements ARINC 429 as defined by the *General Aviation Manufacturers' Association (GAMA) Publication No. 11, ARINC 429 General Aviation Subset, Version 6.0*. The subset of supported

messages is detailed in Section 17. Serial Navigators use the SL30 protocol, which conforms to the NMEA 0183 message specification.

While the navigator's STC may or may not include the AV-30-C, this STC approves the use of the AV-30-C and AV-HSI for IFR navigation with the above-mentioned navigators and receivers. Other ARINC 429-based navigators may be used if they support the above referenced GAMA ARINC 429 specification or prior versions. Other serial VHF navigators may be used if they support the SL30 protocol. Use of all navigators, whether listed above or not, requires completion of the navigator's ground checkout procedure as well as the AV-30-C/ AV-HSI ground checkout procedure in this document.

10.5.2. AV-HSI Specifications:

The AV-HSI dimensions and pinout are as follows:

Characteristics	Specifications
Part Number	UAV-1007846-001
Width	2.3 Inches
Height	0.74 Inches
Depth	2.3 Inches
Weight	1.8 oz (50 grams)
Operating temperature range	-40°C to +70°C
Input voltage range	+10 to +32 VDC
14V current	.02 A typical
28V Current	.01 A typical

Table 27: AV-HSI Specifications

Figure 73: AV-HSI Mechanical Drawing

Pin	Function
DB15 Pin 1	Power
DB15 Pin 2	RS-232 Port 1 In
DB15 Pin 3	RS-232 Port 1 Out
DB15 Pin 4	RS-232 Port 2 In
DB15 Pin 5	RS-232 Port 2 Out
DB15 Pin 6	RS-232 Port 3 In
DB15 Pin 7	RS-232 Port 3 Out
DB15 Pin 8	RS-232 Port 4 In
DB15 Pin 9	Ground
DB15 Pin 10	No Connect
DB15 Pin 11	No Connect
DB15 Pin 12	No Connect
DB15 Pin 13	No Connect

DB9 Pin 8	A429 RX Channel 1 B
DB9 Pin 9	No Connect

Table 29: AV-HSI DB9 Pinout

10.5.3. AV-HSI Installation Overview

An overview of the installation process is provided below. Additional details may be found later in this document.

1) Wire and mount the AV-HSI

- a. Identify the mounting location
 - i. The AV-HSI should be mounted to something rigid in a location that does not interfere with flight control movement
 - ii. The AV-HSI is not waterproof; it must be mounted in a dry location
 - iii. If connecting an AV-Link directly to the AV-HSI, ensure the location is large enough for both
- b. Wire the AV-HSI to the AV-30-Cs, navigators, and autopilot as described below. Detailed information about your navigator can be found in the navigator installation manual
- c. The AV-Link passes through all AV-HSI serial connections so the same backshell wiring works with or without an AV-Link attached
- d. Mount the AV-HSI using appropriate fasteners. Fastener length and type will vary by installation and are therefore not provided in the installation kit. Use AC 43.13-1B for guidance

2) Configure the AV-30-C“(s)” and AV-HSI

3) Perform a ground checkout

4) Record your work in the aircraft logbook

Figure 74: AV-HSI Mounted to AV-Link

10.5.4. AV-HSI Installation Materials and Tools

AV-HSI installation kit includes the following components:

- One 15-pin D-Sub socket connector and shell
- One 9-pin D-Sub socket and shell
- M39029/63-368 sockets

The following additional components will be required:

- Two conductor shielded wire, 22 or 24-gauge, MIL-C-27500 or equivalent
- Single conductor power and ground wire, 22 or 24-gauge, MIL-W-22759/16 or equivalent
- Pins for navigator connectors. See navigator manual for specification
- #8 fasteners appropriate to mount AV-HSI to airframe
- One 9-pin D-SUB Female connector for an update harness

The AV-HSI installation kit includes machined pins. These pins should be crimped with a Daniels AFM8 crimp tool using a K13-1 positioner, or equivalent M22520/2-01 crimp tool.

10.5.5. AV-HSI Wiring

Use the following wiring diagrams to build a harness:

NOTES:

1. USE 22 OR 24 AWG MIL-C-27500 TWO CONDUCTOR SHIELDED WIRE.
2. AV-HSI RS-232 PORT 1 (PINS 2 AND 3) MUST BE CONNECTED TO AN AV-30. REMAINING THREE AV-HSI SERIAL PORTS MAY BE CONNECTED TO ADDITIONAL AV-30 OR TO A SERIAL NAVCOM.
3. UP TO 4 AV-30 MAY BE CONNECTED TO THE AV-HSI. ONLY ONE SERIAL NAVCOM MAY BE CONNECTED.
4. GROUND WIRE SHEILDS TO THE DB15 CONNECTOR RETAINING SCREW USING THE SUPPLIED RING TERMINAL.
5. AV-HSI RS-232 PORT 4 IS USED TO UPDATE THE AV-HSI. SEE IM INSTRUCTIONS FOR TERMINATING.

Figure 75: AV-HSI – AV-30-C Interconnect Drawing

AV-HSI SERIAL VOR/ILS NAVCOM

NOTES:

1. USE 22 OR 24 AWG MIL-C-27500 TWO CONDUCTOR SHIELDED WIRE.
2. RS-232 PORT 3 IS DEPICTED, THOUGH PORT 2 OR 3 MAY BE USED.
3. ONLY ONE VHF NAVIGATION SOURCE MAY BE CONNECTED TO THE AV-HSI.
4. OTHER VHF NAVIGATORS THAT SUPPORT THE APOLLO SL30 PROTOCOL MAY BE COMPATIBLE. REFER TO THEIR INSTALLATION MANUAL FOR PINOUT.

Figure 76: AV-HSI – Serial NAVCOM Interconnect Drawing

Figure 77: AV-HSI – ARINC 429 Interconnect Drawing

Secure harnesses to the AV-HSI using the included screws.

Secure the AV-HSI to your airframe or panel using appropriate fasteners, ensuring the AV-HSI and wiring does not interfere with flight controls.

10.5.6. AV-HSI Update Harness

The AV-HSI software can be field updated. uAvionix intends to expand AV-HSI capability in the future. Provisioning the AV-HSI with a 9-Pin D-SUB Female serial update harness at an accessible location is recommended. Refer to Figure 78 for details.

Figure 78: AV-HSI Update Harness

AV-HSI Serial 4 (Pins 8 and 15) is used for updates. Serial 4 may also be used to connect an additional AV-30-C to the AV-HSI. If Serial 4 is used for an AV-30-C, the installer should consider installing an easy disconnect on the serial line to make AV-HSI Serial 4 accessible for updates. Refer to Figure 79 for details.

Figure 79: AV-HSI Update With AV-30-C Using Serial 4

10.5.7. AV-HSI/AV-30-C Configuration

Each connected AV-30-C must be configured to use the AV-HSI. On each AV-30-C in the installation menu, set SERIAL 1 to AV-HSI and GPS NAV SRC to SERIAL 1 by pressing the center knob to select the item and rotating the center knob to change the option. Pressing the center knob again sets the option.

Configuration of the AV-HSI is performed through the AV-30-C Installation Menu, under the heading AVHSI CFG. This menu appears in white and is selectable if the AV-30-C detects a connected AV-HSI. Select by pressing the center knob.

If the menu item is gray this indicates that the AV-HSI and AV-30-C are not communicating. Confirm the above step was performed successfully and confirm correct wiring.

The AV-HSI CFG submenu contains the following options:

Configuraton Item	Option	Description
SERIAL 2	AV-30-C, NAVCOMM, NMEA 4800, NMEA 9600	The device type connected to SERIAL 2. If no device is connected, set to AV-30-C. NAVCOMM is used to connect a serial VOR/ILS using the SL30 protocol. Only one port may be setup as a NAVCOMM. NMEA 4800 and NMEA 9600 are used when connecting a portable GPS to the AV-HSI. This provides VFR-only guidance.
SERIAL 3	AV-30-C, NAVCOMM, NMEA 4800, NMEA 9600	The device type connected to SERIAL 3. If no device is connected, set to AV-30-C. NAVCOMM is used to connect a serial VOR/ILS using the SL30 protocol. Only one port may be setup as a NAVCOMM. NMEA 4800 and NMEA 9600 are used when connecting a portable GPS to the AV-HSI. This provides VFR-only guidance.
SERIAL 4	AV-30-C, AV-LINK, AVL+AV30	The device type connected to SERIAL 4. If no device is connected, set to AV-30-C. AV-LINK is used when an AV-Link is connected directly to the AV-HSI. AVL+AV30 is used when an AV-LINK is connected directly to the AV-HSI and there's also an AV-30-C connected to the AV-HSI harness using Pins 8 and 15. See the AV-Link section of this document for details on connecting the AV-Link directly to an AV-HSI.
429 RX1 SPEED	HIGH, LOW	The ARINC 429 Speed on RX Port 1. Use LOW unless the connected device requires HIGH. This setting MUST match the speed configured in the connected navigator.
429 RX1 SDI	0 COMMON, 1 PILOT, 2 COPILOT	The ARINC 429 Source Destination Identifier. Use 0 COMMON.
429 RX2 SPEED	HIGH, LOW	The ARINC 429 Speed on RX Port 2. Use LOW unless the connected device requires HIGH. This setting MUST match the speed configured in the connected navigator.

Configuraton Item	Option	Description
429 RX2 SDI	0 COMMON, 1 PILOT, 2 COPILOT	The ARINC 429 Source Destination Identifier. Use 0 COMMON.
429 TX SPEED	HIGH, LOW	The ARINC 429 Speed on the TX Port. Use LOW unless the connected device requires HIGH. This setting MUST match the speed configured in the connected navigator.
429 TX SDI	0 COMMON, 1 PILOT, 2 COPILOT	The ARINC 429 Source Destination Identifier. Use 0 COMMON.
DIGITAL AP	NONE, TYPE 1, TYPE 2	See Autopilot section for details.

Table 30: AV-HSI Configuration Options

Navigator-specific configuration recommendations are as follows. Refer to the installation manual for your navigator for details:

Garmin GNC-215	
Option	Recommended Setting
Interfaces → RS-232	
Format	NMEA 1
Notes and Considerations: 1) The GNC-215 also includes an ARINC-429 connection, which may be used instead of RS-232 to interface with the AV-HSI. This frees up an RS-232 port for other uses. Connect the GNC-215 ARINC output to AV-HSI ARINC RX2. Configure the GNC-215 ARINC 429 TX to LO SPEED and the SDI to COMMON. Refer to the GNC-215 Installation Manual for details.	

Table 36: Garmin GNC-215 Configuration

Garmin GNC-255	
Option	Recommended Setting
Serial Port	
IO MODE	NMEA 1
Notes and Considerations: 1) The GNC-255 OBS is controlled by the AV-30-C when IO MODE is configured as NMEA. If IO MODE is set to NONE, the GNC-255 still outputs deviation data, but the OBS on the GNC-255 and on the AV-30-C operate independently. 2) The GNC-255 has only one RS-232 serial port. Some installations may have this sole port connected to a GPS provide the GNC-255 position data for frequency look-up. If using this configuration, ARINC-429 may be used to interface the GNC-255 to the AV-HSI. Connect the GNC-255 ARINC output to AV-HSI ARINC RX2. Configure the GNC-255 ARINC 429 TX to LO SPEED and the SDI to COMMON.	

Table 37: Garmin GNC-255 Configuration

Apollo/Garmin SL-30	
Option	Recommended Setting
Indicator Head Type	SERIAL
Notes and Considerations: The SL-30 OBS is controlled by the AV-30-C when Indicator Head Type is configured as SERIAL. If the Indicator Head Type is set to NONE, the SL-30 still outputs deviation data, but the OBS on the SL-30 and on the AV-30-C operate independently.

Serial Mode (SrMd)	Dir

Table 41: VAL NAV 2000 Configuration

In addition to interfacing with a GPS and a VHF navigation source, the AV-HSI synchronizes data between all connected AV-30-C. The synchronization of each field is individually controllable through the State Sync Menu in the AV-30-C Installation Menu.

Within this menu select the SOURCE as AV-HSI

The following fields may be synchronized using the AV-HSI:

Field	Description
Heading Bug	When enabled, changes to the heading bug on one AV-30-C updates all other enabled AV-30-C.
Omni-Bearing Selector	When enabled, changes to the OBS on one AV-30-C updates all other enabled AV-30-C.
Set Altitude	The Set Altitude, also displayed as SALT, is an altitude target used by the autopilot.
Set Vertical Speed	The Set Vertical Speed, also displayed as SVS. Note that ARINC 429 based autopilots do not use this field from the AV-30-C.
Autopilot Mode	When enabled, changes to the autopilot mode on one AV-30-C updates all other enabled AV-30-C.
CDI Source	The navigation source, GPS or VLOC. Having this feature enabled changes the source on all connected AV-30-C. If it is desired to have AV-30-C operate independently, example have one display VLOC and one display GPS, disable this synchronization.
Barometric Pressure	When enabled, changes to the baro setting on one AV-30-C updates all other enabled AV-30-C.
Outside Air Temperature	When enabled, data from one OAT probe connected to an AV-30-C is shared with all other AV-30-C.
Directional Gyro Setting	When the pilot sets the DG, that setting is synced to all AV-30-C. For installations with the AV-MAG, this should be disabled.
Alerts	The AV-HSI continuously compares the attitude solution generated by every connected AV-30-C and will alert if they differ by more than 8 degrees of pitch or roll. This alert can be disabled with this setting.

Table 42: AV-HSI Synchronized Data

10.5.8. AV-HSI Ground Checkout

Before flight with the AV-HSI, perform the following steps:

- 1) Ensure all connected AV-30-C are receiving data from the GPS navigator by putting the navigator into self-test mode. Observe lateral and vertical course deviations match expected values of the GPS self-test. Most GPS navigators enter self-test on boot-up. Refer to your GPS manual for details. This verifies the ARINC 429 receive path from the GPS.
- 2) If your GPS self-test mode displays OBS, observe the OBS being sent by the AV-30-C. Change the AV-30-C OBS and observe the

value being reflected on the GPS self-test screen. If your GPS self-test mode does not display OBS, verify the OBS is being received by the GPS by setting up OBS or Hold mode. This verifies the ARINC 429 transmit path to the GPS.

- 3) Tune to a VOR, VOT, or ILS if available at your airport and set the AV-30-C NAV SRC to VLOC. Ensure all connected AV-30-Cs are receiving VHF NAV information. If no VHF NAV source is available at your airport, use a navigation signal generator like a Sun Avionics AV-17, Aeroflex IFR-4000, or Viavi AVX-10k. This verifies the VHF NAV receive path from your navigator.
- 4) Complete ground checkout procedures as required by your navigation source installation manuals.

10.5.9. AV-HSI Flight Checkout

Before flight into actual IMC conditions, a flight test should be performed verifying the performance of the AV-30-C, AV-HSI, and your navigator by flying each of the approach types supported by your installation in VFR conditions.

This serves to verify the installation and the pilot's ability to use the equipment. Consider flying with a CFI familiar with AV-30-C operations before solo flight in IMC conditions.

11. Setup & Configuration

11.1. Statup and Common Controls

When powered on, the initial splash screen presents the company logo, unit model number, and the currently installed software version.

Figure 85: Splash Screen

Operation in AI, DG, and MFD modes share common user interface controls as follows:

Figure 86: Common User Interface Components

11.2. Available Menus

Setup and configuration menus are divided into three categories as follows:

- Edit Fields Menu (Pilot accessible)
- Setup Menu (Pilot accessible)
- Installation Menu (Non-Pilot accessible)

The edit fields menu allows the pilot to configure the display to show the various supplemental parameters in the desired locations. Details of this are covered in *AV-30-C Pilot's Guide UAV-1003946-001* and not addressed here.

The Setup Menu allows the pilot to set various configurations and alerting limits as desired for the type of operations being performed. These are also covered in the Pilot's Guide referenced above.

The installer may wish to pre-configure some or all these settings for the pilot, but the default settings are acceptable.

NOTICE

The Installation Menu is for settings that are not normally required to be adjusted during flight. The installer ***must*** review and set these according to the installation configuration.

12. Installation Menu

The installation menu is used to configure the AV-30-C after installation and should only be accessed on the ground and changed by the installer.

To enable access to the installation menu, ensure the unit is completely turned off. Press and hold the main control knob while power is applied.

Figure 87: Installation Menu Access

Keep the knob pressed until the startup logo appears. The installation menu will now be enabled for access but will not automatically appear on the screen.

Ensure the unit is in AI or DG mode; select the mode by pressing and holding the center button until the mode display changes. When in AI or DG mode, press and release the left MENU button three times until "INSTALL / ROT TO SEL" appears. The sequence of fields displayed is shown in Figure 88.

Figure 88: Installation Menu Access

Rotating the knob left and right will access the various parameters that may be configured.

Figure 89: Installation Item Selection

Pressing the knob when the desired field is shown will activate the setting to be adjusted. Turn the knob to adjust the value.

Figure 90: Installation Item Adjustment

After adjustment, pressing the knob again will exit the editing mode but the installation menu will remain active.

Pressing DONE or a lack of user input for 30 seconds will exit the installation menu and return to the primary screen.

Record configured values on a printed copy of Table 43 and retain in aircraft records.

Label	Description	Possible Values	Configured Value(s)
UNIT FUNCTION	Unit functionality	Set to default mode: AI* or DG	
FUNCTION LOCK	Functionality Lock	If locked, pilot may not change unit function	
AI PAGES	Number of AI Pages to display	1, 2, 3*	
DG PAGES	Number of DG Pages to display	1, 2, 3*	
MFD PAGES	Number of MFD Pages to display	DISABLED, 1*	
CDI PAGES	Number of CDI Pages to display	DISABLED, 1, 2*	
PITCH TRIM ^[AI]	Pitch trim	Trim as needed: ± 27 Degrees (0*)	
ROLL TRIM ^[AI]	Roll trim	Trim as needed: ± 5 Degrees (0*)	
SLIP TRIM ^[AI]	Slip trim	Trim as needed: ± 5 Degrees (0*)	
OAT TRIM ^[AI]	OAT probe trim	Trim as needed: ± 200 (Unitless) (0*)	
SPD ASST ^[AI]	Speed Assist – use airspeed to assist attitude calculation	ON* or OFF	
PITOT ZERO	Pressure sensor age compensation	Automatically determined by measurement	
IAS TRIM LO ^[AI]	IAS trim at low speed	Trim as needed: ± 100 (in IAS UNITS) (0*)	
IAS TRIM HI ^[AI]	IAS trim at high speed	Trim as needed: ± 100 (in IAS UNITS) (0*)	
ALT TRIM LO	Barometric altitude trim	Trim as needed: ± 500 Feet	
ALT TRIM HI	Barometric altitude trim at value > 10,000' plus ALT TRIM LO	Trim as needed: ± 500 Feet	
AOA FUNC ^[AI]	Angle of Attack Alert	ENABLED*, DISABLED	
IAS UNITS ^[AI]	IAS display units	Knots* (KTS), Miles Per Hour (MPH), or Kilometers Per Hour (KPH)	
TAS UNITS ^[AI]	TAS display units	Knots* (KTS) , Miles Per Hour (MPH), or Kilometers Per Hour (KPH)	
IAS VSO ^[AI]	Stalling speed in landing configuration	Set to match limits: 40 to 555 (50*) in IAS UNITS	
IAS VS1 ^[AI]	Stalling speed in a specific configuration	Set to match limits: 40 to 555 (60*) in IAS UNITS	
IAS VFE ^[AI]	Maximum flap extended speed	Set to match limits: 40 to 555 (100*) in IAS UNITS	
IAS VNO ^[AI]	Maximum structural cruising speed	Set to match limits: 40 to 555 (150*) in IAS UNITS	

Label	Description	Possible Values	Configured Value(s)
IAS VNE ^[AI]	Never exceed speed	Set to match limits: 40 to 555 (175*) in IAS UNITS	
IAS VMC ^[AI]	Minimum control airspeed with the critical engine inoperative	Set to match limits: 40 to 555 or disabled* in IAS UNITS	
IAS VYSE ^[AI]	Speed for best rate of climb OEI (single engine)	Set to match limits: 40 to 555 or disabled* in IAS UNITS	
BARO UNITS	Altimeter barometric units	Inches of Mercury* (INHG), millibars (MB), hectopascals (HPA)	
TEMP UNITS	OAT units	Celsius* (C) or Fahrenheit (F)	
WIND UNITS	Wind display units	Knots* (KTS), Miles Per Hour (MPH), or Kilometers Per Hour (KPH)	
GPS NAV SRC	Serial GPS format	NONE, SERIAL 1*, SERIAL 2	
SERIAL 1	GPS serial input	NONE, AV 9600*, NMEA 4800, NMEA 9600, BCNX GPS, AV-HSI	
SERIAL 2	Auxiliary serial input	NONE*, BEACON X, AV-APA, AEROCRUZE, PRO PILOT	
SERIAL 3	System serial input	NONE, AVLINK*, EFIS, EFIS+AVLINK	
SERIAL 4	AV-Mag serial input	NONE*, AVMAG	
AVHSI CFG	Configuration of the AV-HSI accessory	SERIAL 2: AV-30*, NAVCOMM, NMEA 4800, NMEA 9600 SERIAL 3: AV-30*, NAVCOMM, NMEA 4800, NMEA 9600 SERIAL 4: AV-30*, AV-LINK, AVL+AV30 429 RX1 SPEED: HIGH, LOW* 429 RX1 SDI: 0 COMMON*, 1 PILOT, 2, COPILOT 429 RX2 SPEED: HIGH, LOW* 429 RX2 SDI: 0 COMMON*, 1 PILOT, 2, COPILOT 429 TX SPEED: HIGH, LOW* 429 TX SDI: 0 COMMON*, 1 PILOT, 2, COPILOT DIGITAL AP: NONE*, TYPE 1, TYPE 2	
STATE SYNC	Synchronization of pilot settings across multiple AV-30-Cs using AV-HSI or between an AV-30 and EFIS	Source: None, AV-HSI*, EFIS Heading Bug: No, Yes* OBS: No, Yes* Set Altitude: No, Yes*	

Label	Description	Possible Values	Configured Value(s)
		Set Vertical Speed: No, Yes* Autopilot Mode: No, Yes* CDI Source: No, Yes* Baro Setting: No, Yes* OAT: No, Yes* DG: No, Yes* Alerts: No, Yes*	
AID MODE	AHRS aiding mode	NONE*, MAG1, MAG2, AVMAG ^[1]	
AVMAG INSTL	AV-Mag Installation	See Table 34 – AV-Mag Submenu for submenu description	
AVMAG CAL	Calibrates external magnetometer	Perform calibration after installation – only available for units with external magnetometer	
AVMAG YAW	AV-Mag installed Yaw angle trim	Trim as needed: ±15 Degrees (0*)	
MAG MONITOR	Magnetometer monitor	Push to view	
VIBE MONITOR	Vibration monitor	Push to view	
GYRO CAL	Calibrates aircraft gyros	Perform at installation or software update	
INT MAG CAL	Calibrates internal magnetometer	Perform in-flight calibration after installation – only available for units with internal magnetometer	
AV-APA CFG	AV-APA Configuration	NONE*, S-TEC	
AV-APA THRU	AV-APA Serial Passthrough	NONE*, BEACON X	
GPSS GAIN	Increase AV-APA GPSS GAIN	As needed, 0.0 to 3.0, 1.0*	
ADVANCED AP	Advanced autopilot feature unlock	LOCKED*, UNLOCKED	
DEMO MODE	Demo mode	DISABLED*, MODE 1, MODE 2	
RESET AVLINK	Factory reset operation on attached AV-Link	Push to execute	
BEACONX CFG	BeaconX transponder installation and configuration	Push to execute	
BEACONX GTM	BeaconX ground test mode	Push to execute	
GET CONFIG	QR Code containing configuration parameters	Push to execute then use a smart phone camera to scan the code and follow the detected http link	

Label	Description	Possible Values	Configured Value(s)
SW PART NUM	Software part number	For reference	
SW VERSION	Software version	For reference	
SW CHECKSUM	Software checksum	For reference	
BL VERSION	Bootloader Version	For reference	
DEVICE ID	Unique device ID of this AV-30-C	For reference when using AV-Link with multiple AV-30-C. This differentiates multiple units displayed on the AV-Link web page.	
AVMAG SW PN	AV-Mag Software part number	For reference	
AVMAG SW VER	AV-Mag Software version	For reference	
AVAPA SW PN	AV-APA Software version – Not approved for certified aircraft	For reference	
AVAPA SW VER	AV-APA Software part number – Not approved for certified aircraft	For reference	
AVLINK SW PN	AV-Link Software part number	For reference	
AVLINK SW VER	AV-Link Software version	For reference	
AVHSI SW PN	AV-HSI Software part number	For reference	
AVHSI SW VER	AV-HSI Software version	For reference	
BATTERY	Battery type	For reference	
SW CERT	Software certification	For reference	

Table 43: Installation Menu Setting

[AI] Available when Install Menu accessed through AI mode only

[1] Only valid for AV-Mag

* Initial factory value

Label	Description	Possible Values	Configured Value(s)
INTERFERENCE	Checklist of systems to exercise and monitor for excessive interference with the AV-Mag	LIGHTS, AVIONICS, CONTROLS, OTHER, ALL ON, REVIEW	
INSTL ORIENT	Orientation of the installed AV-Mag	See Table 16 for more details	
AV-30	Angles of the AV-30-C instrument in the stationary aircraft.	No user entry. Information for AV-Mag installation only. AV-Mag should be installed as closely as possible to the AV-30-C angles.	
ROLL ANGLE	Roll angle of the AV-Mag as mounted in the stationary aircraft	Automatically measured	
PITCH ANGLE	Pitch angle of the AV-Mag as mounted in the stationary aircraft	Automatically measured	
SAVE (Y/N)	Option to save changes to automatically measured roll and pitch angles	YES, Y/N?, NO.	
COMPLETE	Final screen of installation submenu. The next step of installation is to run the calibration procedure.	Information only	

Table 44: AV-Mag Submenu

12.1. Mandatory Settings

The following settings are mandatory for each installation.

12.1.1. Unit Function

- Set to AI if installation is replacing an existing Attitude Indicator.
- Set to DG if installation is replacing an existing Direction Indicator.
- Set to either when installation is as a non-required instrument. In this mode, this setting is the initial default operating mode if the function lock below is not set to locked. With this setting, the pilot may toggle the mode during flight.

12.1.2. Function Lock

Enable function lock for primary AI and DG installations. This prevents the pilot from toggling the operating mode.

Installation on a non-required instrument may be locked or not locked, based on owner preferences. Pressing and holding the center knob

when functionality is not locked will toggle between AI, DG, MFD, and CDI modes.

12.1.3. Trim

Access to trim settings for various values can be accomplished by accessing the Install menu while in AI mode only.

- Set Pitch, Roll and Slip Trim to accommodate any mounting variations.
 - Accurate pitch, roll and slip trim is important to ensure optimal performance
- Set IAS and Altitude Trims to match existing instrumentation or test equipment as needed.

NOTICE

IAS and Altitude are factory calibrated to ensure accuracy. Depending on installation or correspondence requirements, or to accommodate sensor aging, trimming of both functions can be achieved.

- Trim the OAT values to match that of a secondary temperature source such as ATIS.

12.1.4. Speed Assist

Use pitot-static data to improve attitude accuracy.

This setting should be set to ON unless this installation cannot meet required pitot-static connections and performance.

12.1.5. Angle of Attack

Angle of Attack Upper and Lower Limits are set in flight using a procedure documented in the *AV-30-C Pilot's Guide*
UAV-1003946-001

Correct setting of pitch and roll trim is required to achieve accurate Angle of Attack indication.

NOTICE

The AV-30-C can not accurately calculate AoA below 25 knots and will not display the indicator. If the airspeed is too low or the AV-30-C is not otherwise able to provide AoA, the AoA label on screen is covered with a red X.

Figure 91: Invalid AoA - Red X

If the Angle of Attack feature is enabled, the graphical indicator is available and alerts are enabled. Alerts can be disabled in the Setup Menu if desired. The Angle of attack feature may be disabled entirely in the Installation Menu. This will prevent the Angle of Attack graphical indicator and alerts from being available to the pilot.

12.1.6. V-Speeds

Set each of the V-Speeds to the values that correspond to the installation aircraft. Units correspond to the IAS UNITS setting.

12.1.7. Display Units

- Set the IAS UNITS to match that of the existing airspeed indicator. IAS and GPS ground speed are displayed in these units
- Set the TAS units to owner / pilot preference.
- Set the BARO UNITS to match that of the existing altimeter.
- Set OAT units to owner / pilot preference.

12.1.8. Serial Inputs

GPS NAV SRC

Multiple serial ports support GPS sources. Set to the serial port on which your GPS source is installed.

Value	GPS Source
NONE	None available
SERIAL 1	Specified in SERIAL 1 setting

Value	GPS Source
SERIAL 2	Specified in SERIAL 2 setting

SERIAL 1

This serial port corresponds to DB-15 pins 2 and 3. Set according to the type of the installed GPS navigator on this port.

Most handhelds are NMEA outputs while most panel mounted navigators are Aviation format. When allowed by installation, a tailBeaconX can also supply GPS input by selecting BCNX GPS.

Set to the corresponding GPS navigator input type.

Value	Serial 1 Source
NONE	None available
AV 9600	Aviation format (9600 bps)
NMEA 4800	NMEA format (4800 bps)
NMEA 9600	NMEA format (9600 bps)
BCNX GPS	tailBeaconX in receive only (parallel) mode, Only enable when authorized by separate approval
AV-HSI	When AV-HSI is connected

SERIAL 2 Set SERIAL 2 to NONE unless a tailBeaconX or AV-APA is connected.

Value	Serial 2 Source
NONE	None available
BEACON X	tailBeaconX
AV-APA	Analog Autopilots connected to AV-APA
AEROCRUZE	Direct connect Aerocruze autopilot to Serial 2 is not currently approved for certified installations. Do Not Enable unless authorized by follow-on approval
PRO PILOT	Direct connect of Pro Pilot autopilot to Serial 2 is not currently approved for certified installations. Do Not Enable unless authorized by follow-on approval

For parallel connection of a tailBeaconX to two AV-30-C, connect and configure the AV-30-C according to Figure 92.

Figure 92: Parallel tailBeaconX GPS Connections

SERIAL 3

Serial 3 is the system serial port. If using the AV-Link, set SERIAL 3 to AVLINK to enable MFD page.

Value	Serial 3 Source
NONE	None available
AVLINK	AV-Link is installed, MFD enabled
EFIS	Connection to third-party EFIS. Do Not Enable unless authorized by follow-on approval
EFIS+AVLINK	Connection to a third-party EFIS with an AV-Link inline. Do Not Enable unless authorized by a follow-on approval

SERIAL 4

If using the AV-Mag, set SERIAL 4 to AVMAG to enable the external magnetometer aiding.

Value	Serial 4 Source
NONE	None available
AVMAG	AV-Mag is installed

12.1.9. AID Mode

Set AID MODE to NONE or AVMAG.

There are up to 3 options for the AID MODE, which controls the method of aiding the AHRS DG functionality.

Value	AHRS Aiding Source
NONE	None used
MAG1	Internal magnetometer provides correction data to DG – Do Not Enable unless authorized by follow-on approval
MAG2	Internal magnetometer provides correction data to DG and aiding to core AHRS algorithm – Do Not Enable unless authorized by follow-on approval
AVMAG	External magnetometer provides continuous heading data to DG and aiding to core AHRS algorithm. AV-Mag only.

Rotate the center knob until "AID MODE" is displayed. If the internal magnetometer is available (P/N UAV-1003429-002) then you will have a choice of NONE, MAG1, and MAG2. If the internal magnetometer is not found, only "NONE" will be displayed. If SERIAL 4 is set to AVMAG, AID MODE will be automatically set to AVMAG and is otherwise not settable.

Figure 93: AID Mode Selection

Press the center knob and rotate to select your choice of Magnetometer aiding and then press the center button to confirm your choice.

12.1.10. Demo Mode

Set Demo Mode to DISABLED. Demo Mode will automatically be disabled when reaching an airspeed of 35 knots.

12.2. System Checkout

The following procedures must be performed prior to returning the aircraft to service.

12.2.1. Alignment

During initial startup, the ALIGN annunciator should be presented and flash. This indicates internal sensor stabilization is occurring. During the alignment, do not move the aircraft.

This should extinguish within 3 minutes, at which point valid attitude or direction indication is displayed.

If power is removed from the unit while it is still aligning the unit will go to battery mode until it has completed the alignment process.

Figure 94: Aligning Annunciator

If the indicator is not extinguished within 3 minutes, reference the troubleshooting section of this document for additional information.

12.2.2. Gyro Calibration

As units age or experience unusual conditions, the precision gyroscopic sensors may need to be re-calibrated. This can be accomplished in the field using the procedure noted here. At least 15 minutes of warmup is required before performing the AV-30-C gyro calibration.

- 1) Before applying power, press and hold the center rotary knob and apply power. As the splash screen appears, check that a minimum version of 2.1.2 is displayed. Gyro Calibration must be completed on all units with software version 2.1.2 or later.
- 2) With the AV-30-C in the AI mode, enter the "Install Menu" page by pressing and releasing the left button repeatedly until the 3rd menu is displayed. The aircraft must be on the ground with no movement.

Figure 95: Install Mode Selection

- 3) **It is critical to ensure the aircraft is completely motionless** and on the ground during the next several steps. The aircraft should be in a hangar and must not be affected by wind or other sources of aircraft movement. **Do not leave the aircraft during the calibration.**
- 4) Rotate the "Install Menu" to "GYRO CAL" and press the center button to choose calibration. If sufficient warmup time has not elapsed, a "Not ready to calibrate" message and countdown will be indicated. Otherwise, initiate calibration by pressing the right button.

Figure 96: Gyro Calibration Selection

- 3) "Calibration in progress" will be displayed with a percentage complete.

Figure 97: Gyro Calibration Procedure

- 3) AV-30-C will indicate "Calibration successfully completed / Press DONE".

Press the left button under "DONE" and the calibration will be complete. If an error is shown, repeat the calibration process.

12.2.3. AV-Mag Calibration Check

With the aircraft engine running, lights on, and pitot heater on, orient the aircraft at each heading below and record the heading reported by the AV-30-C. Turn on the HDG textual overlay to obtain a precise value. Note: constant error of up to 3 degrees can be corrected using the AV-MAG YAW option in the Installation Menu. If experiencing a larger error, adjust your AV-MAG installation to align with forward flight and re-calibrate.

Parameter	Value
Installation Location on Aircraft	
AV-Mag Orientation	
Interference Range	
Max Interferer	
Min Interferer	
AV-30-C Roll Angle	
AV-30-C Pitch Angle	
AV-Mag Roll Angle	

Parameter	Value
AV-Mag Pitch Angle	
AV-Mag Yaw Angle (post-calibration)	

Table 51: AV-Mag Installation Parameters

Magnetic Heading	AV-30-C+AV-Mag Reported Heading	Magnetic Heading	AV-30-C+AV-Mag Reported Heading
0		180	
30		210	
60		240	
90		270	
120		300	
150		330	

Table 52: Calibrated Heading Check

12.2.4. OAT Interface

If an Outside Air Temperature (OAT) probe is connected, utilize the display customization guidance provided in the Pilot's Guide to configure the display to show OAT in at least one textual display field.

Figure 98: OAT Indicator

Note that OAT calibration is performed in the Setup procedures. This step only ensures that the OAT probe is detected properly.

12.2.5. GPS Navigator Interface

If a GPS Navigator is connected, utilize the display customization guidance provided in the Pilot's Guide to configure the display to show GPS navigational data in at least one textual display field.

The image below shows a typical configuration that the pilot may setup.

Figure 99: GPS Data Elements

On the GPS navigator, set a destination waypoint and initiate a direct-to sequence. Note that not all navigators will output serial data until a waypoint has been selected and navigation initiated.

12.2.6. Vibration Check

Prior to flight, a vibration check must be completed. The vibration check helps ensure the vibration characteristics of the aircraft and installation are suitable for use. The check procedure is performed during an engine run-up.

- 1) Before applying power to the AV-30-C, press and hold the center rotary knob and apply power. As the splash screen appears, check that a minimum version of 2.1.2 is displayed.
- 2) Enter the "Install Menu" page by pressing and releasing the left button repeatedly until the 3rd menu is displayed.
- 3) Rotate to "VIBE MONITOR" and press the center button.

Figure 100: Vibe Monitor Selection

- 4) The Vibration Monitor will display current and peak values for the Accelerometer and Gyroscope.

Figure 101: Vibe Monitor Operation

- 5) Perform an engine run-up, slowly increase engine power from idle to full and back to idle.
- 6) Record the peak values observed for both the Accelerometer and Gyroscope.

Peak values for the Accelerometer should not exceed **110**, and for the Gyroscope should not exceed **40**. If excessive values are observed, vibration must be mitigated to ensure expected performance. Consider the following:

- Ensure proper propeller balance. Perform dynamic propeller balancing.
- Replace worn engine mounts and address causes of high engine vibration.
- Ensure the AV-30-C is not mounted in a location subject to high vibration. This can often be detected by placing your hand on various locations in the panel, and can be caused by poorly supported panel regions, adjacent equipment, or proximity to engine structure.
- On isolated panels, replace the grommets; concurrently, ensure isolated panels have a ground strap.
- Ensure all mounting hardware is firmly attached.
- Check for rub marks on the AV-30-C case.
- Ensure connectors are firmly attached, and all cabling is firmly supported and not causing undue flex. The cabling must not be hitting or close to a moving surface (e.g. control yoke).

12.2.7. Air Data – Pitot Zero

Airspeed is computed by measuring the pressure differential between the Pitot and Static connections on the AV-30-C. Variation in installation and uneven aging of the pressure sensors may require field adjustment to maintain accuracy.

This Pitot Zero procedure must be performed on a new installation. Pitot Zero should be performed before setting the Indicated Airspeed trim. Running the Pitot Zero will reset Indicated Airspeed trim to defaults and the trim measurement will need to be repeated.

Additionally, the procedure should be performed every 24 calendar months as recommended or required by the AV-30-C *Instructions for Continued Airworthiness, UAV-1004045-001*.

The PITOT ZERO function is available in the installation menu.

To execute the PITOT ZERO function, go to the AI mode screen, go to the AV-30-C installation menu and select PITOT ZERO. The pitot tube must be uncovered and the aircraft must be in a still air environment. Press and release the right button. If the measurement was successful a message stating "Measurement Complete P-S Difference 0.x" will appear. Press and release the left button or the center knob to exit. If the measurement failed a message stating "Measurement Failed" will appear. Check the measurement conditions and try again. If the function still fails, please contact product support.

12.2.8. Air Data – IAS Trim

As the AV-30-C ages or is exposed to unusual conditions, the pressure sensors may require field adjustment to maintain accuracy. If the indicated air speed appears to be accurate at some airspeeds and increasingly inaccurate as airspeed increases or decreases, a trim adjustment may be beneficial. This function requires a calibrated air data test set connected to the AV-30-C to simulate multiple airspeeds.

Pitot Zero should be executed prior to setting IAS trim. Running Pitot Zero will reset IAS trim to defaults.

To execute this function, select the AI Mode on the AV-30-C. Go to the installation menu and select IAS TRIM LO. Set the air data test set to 45 knots or the stall speed or your aircraft, whichever is greater. Press and release the center knob then turn the knob until the airspeed displayed on the AV-30-C is equal to the airspeed indicated on the test set. Press and release the center knob to set.

Now increase the airspeed on the air data test set to a value at least 70 knots higher than the airspeed used to set the LO trim point. Using your aircraft's high-speed cruise airspeed is recommended. Go to the IAS TRIM HI menu item. If the AV-30-C perceives the airspeed difference to be less than 70 knots more than the speed used to set the LO trim, IAS TRIM HI will be grayed out and un-selectable. If that is the case, keep increasing the IAS on the test set until IAS TRIM HI turns from gray to white. Press and release the center knob then turn the knob until the IAS displayed is equal to the IAS on the air data test set. Press and release the center knob to exit the menu.

Record the IAS TRIM LO and IAS TRIM HI values in the aircraft records.

12.2.9. Air Data – Altitude Trim

As the AV-30-C ages or is exposed to unusual conditions, the pressure sensors may require field adjustment to maintain accuracy. If the Altitude appears to be accurate at some altitudes and increasingly inaccurate as you increase or decrease altitude, a trim adjustment may be beneficial. This function requires a calibrated air data test set connected to the AV-30-C to simulate multiple altitudes.

To execute this function, go to the AI mode page on the AV-30-C and set the barometric pressure to 29.92. Now go to the installation menu and select ALT TRIM LO. Set the air data test set at a low altitude point somewhere between -1,000' and 14,900'. Press and release the center knob then turn the knob until the value displayed for BaroCorrAlt + Trim: is equal to the altitude on the air data test set. Press and release the center knob to exit the menu.

Now increase the altitude on the air data test set to a value at least 10,000' feet higher than the low altitude. Go to the ALT TRIM HI menu item. If the AV-30-C perceives the altitude difference to be less than 10,000', ALT TRIM HI will be grayed out and un-selectable. If that is the case, keep increasing the altitude until ALT TRIM HI turns from gray to white. Press and release the center knob then turn the knob until the value displayed for BaroCorrAlt + Trim: is equal to the altitude on the air data test set. Press and release the center knob to exit the menu.

Record the ALT TRIM LO and ALT TRIM HI values in the aircraft records.

12.2.10. AV-APA Checkout

Power up the AV-30-C and AV-APA. Observe that the 'NO AP' flag is not displayed. This flag indicates that the AV-APA is not providing valid heading input to the autopilot. If the 'NO AP' flag is present on startup, it is an indication that the AV-APA and AV-30-C are not communicating. Check wiring to resolve. The 'NO AP' flag can also indicate that the pilot has selected a mode and the required data isn't available. For example, a pilot selecting a GPS-based mode without a GPS or flight plan loaded.

Follow the ground checkout procedure from your autopilot installation manual. In general, this involves setting the autopilot to heading mode and observing that the flight controls move in the correct direction as the heading bug is changed left and right of the current heading.

12.2.11. EMC Checkout

An EMC check should be performed after the AV-30-C installation is complete. The EMC check verifies that the newly installed equipment is not producing interference to other avionics and that the existing avionics are not producing interference to the AV-30-C. The testing assumes the AV-30-C operational check has been completed and that the installed avionics to be tested are all in working condition.

- 1) Power on all avionics except the AV-30-C.
- 2) Verify all existing avionics are functioning properly. Some systems may require startup messages to be acknowledged/cleared to verify proper function.
- 3) After confirming all existing avionics are functioning properly, power off all existing equipment.
- 4) Power on the AV-30-C and perform the following tests as they apply to the existing aircraft equipment.
- 5) Observe load shedding procedures as appropriate for the aircraft during testing to ensure adequate power to complete the testing while maintaining enough reserve to support pre-flight and engine start.

VHF COM RADIOS

Verify AV-30-C operates without interference from the VHF COM operation.

- 1) Power on the VHF COM radio.
- 2) Transmit on a low, medium, and high frequency. Unused frequencies are recommended for this test. Example frequencies: 118.0, 126.0, and 135.0 Mhz.
- 3) During each transmission verify the AV-30-C continues to operate properly.

Verify each radio operates without interference from the AV-30-C.

- 1) Monitor a local frequency and verify there are no unintended squelch breaks or other tones that would interfere with communications.
- 2) Monitor a remote (distant) frequency and verify there are no unintended squelch breaks or other tones that would interfere with communications.
- 3) Monitor an unused frequency and verify there are no unintended squelch breaks or other tones that would interfere with communications.

VHF NAV RADIOS

Verify VHF NAV operates without interference from the AV-30-C.

- 1) Power on the VHF NAV radio.
- 2) Monitor a local, remote, and unused frequency.
- 3) Verify there are no misleading navigation indications during the monitoring of each frequency.
- 4) Verify audible station ID and that the station is clear of audio interference that would prevent identification.

ADDITIONAL AVIONICS

Additional Avionics should be tested according to the manufacturer EMC/EMI test procedures. This testing assumes the existing

equipment is functional and operating correctly at time of testing. The following summarizes a typical EMC test.

- 1) Operate the AV-30-C.
- 2) Operate the existing installed avionics according to manufacturer instructions. If capable, utilize the device to transmit and receive functions through a range of values.
- 3) Verify no errors, warnings, or unexpected operation is observed on the AV-30-C during operation of the installed avionics.
- 4) Verify no errors, warnings, or unexpected operation is observed on the installed avionics during operation of the AV-30-C.

13. Troubleshooting

The following steps are to aid in identifying installation or unit performance related issues:

Issue		Possible Reason
Power		
Unit does not power-on.	Check associated breakers.	
	Ensure aircraft battery is greater than 10 VDC.	
	Check wiring and pinouts.	
Unit will not shut off, even if power is removed.	Ensure no pitot or static blockage or line kinks are present (locking pressure and airspeed indication over 40 knots).	
	Pitot and Static sensors need to be zeroed as described in Section 12.2.7	
Stabilization		
Unit will not stabilize and aligning annunciator remains on.	Return to factory for service if unit does not align within 3 minutes of power-on.	
DG drifts more than 30 degrees per hour.	Make sure you are running the newest software.	
	Complete Gyro Cal	
	Enable magnetometer aiding with AV-Mag external magnetometer – see Section 12.1.9	
Unit flashes “NO MAG” on right side	Check that you have selected the intended internal or AV-Mag external magnetometer function.	
	Check AV-Mag wiring for intermittent connection or poor grounding.	
Unit flashes “MAG CAL” on the right side	Complete the AV-Mag Calibration procedure in Section 10.3.11 if using the external magnetometer. Complete a calibration flight if using the internal magnetometer.	
Battery		
Battery indication shows FAIL.	Contact uAvionix support.	
Trim		
Roll, Pitch or Slip show small but constant error.	Ensure unit is level in panel (using a bubble level or similar)	
	Set trim adjustment in Installation menu. See Section 12.1.3.	
Airspeed or Altitude shows small but constant error.	Set trim adjustment in Installation menu. See Section 12.2.8 and Section 12.2.9	
Interface		
GPS information is expected but does not show up in data overlays.	Check GPS input is configured to match the connected GPS serial data type and speed.	
	Set direction indication to GPS TRK.	
“NO DATA” is shown.	Check interface cables and pinouts.	
“NO GPS” is shown.	Check GPS input is configured to match the connected GPS serial data type and speed.	

Issue		Possible Reason
Splash screen shows "ERROR: Problem with calibration or bootloader. Factory service required."		Factory calibration has been partially lost or bootloader failed. Contact uAvionix support
Splash screen shows "ERROR: CFG reset to defaults. Reconfig required."		Integrity check failed for saved configuration. Installed settings need to be retrieved from log book and reentered. AV-Mag calibration, airspeed trim, and altitude trim are not affected. Contact uAvionix support for additional help if needed.
Splash screen shows "ERROR: PROV value check failure. Service required."		Contact uAvionix support
Splash screen shows "ERROR: F-CAL value check failure. Verify user calibration data."		Integrity check failed for saved field calibration items. AV-Mag calibration, IAS trim, and Altitude trim settings procedures need to be redone. Contact uAvionix support for additional help if needed.
Alerts		
Audio alerts not heard over the audio system		Check wiring and ensure alerts are enabled in the Setup menu.
		Ensure unswitched input is available on the audio panel.
		Verify volume setting is sufficiently high in the Setup menu.
Nuisance alerts are generated.		Ensure alerting limits are configured as desired in the Setup menu.
		Disable any undesired alerting features in the Setup Menus.
AV-APA		
"NO AP" flag on screen		"No AP" indicates either: 1) The AV-30-C isn't communicating with the AV-APA. Check wiring. 2) The autopilot mode is set to a GPS mode for which data isn't available. E.g. WPT BRG is selected but there is no waypoint in the GPS. Check GPS or change autopilot mode.
Autopilot doesn't respond to heading changes in the AV-30-C.		In the AV-30-C installation menu, ensure AV-APA CFG is set to the autopilot type used. Setting to none causes the AV-APA to output nothing.
AV-HSI		
AVHSI CFG menu stays gray and is not selectable.		The AV-HSI Configuration Menu is only selectable if the AV-HSI and AV-30-C are communicating. 1) Ensure that AV-30-C SERIAL 1 is set to AV-HSI 2) Check wiring
AV-MAG		
Unit flashes "NO MAG" on right side		Ensure software version 2.4.1 or newer is loaded on the AV-30-C. If still persistent, check AV-Mag wiring for intermittent connection or poor grounding.
		Check that you have selected the intended internal or AV-Mag external magnetometer function.
Unit flashes "MAG CAL" on the right side		Complete the on-ground 12-point calibration in Section 10.3.11

If contacting product support, the AV-30-C can produce a summary of its configuration settings by generating a QR code that can be scanned and decoded with a smart phone or tablet. The decoded QR code is a link to a web page with the configuration parameters displayed.

Go to the installation menu and advance to "GET CONFIG". A QR code will be generated similar to the one in Figure 108.

Figure 108: QR Code of Configuration Settings

14. Instructions for Continued Maintenance & Operation

See *AV-30-C Instructions for Continued Airworthiness, UAV-1004045-001* for replacement, inspection requirements and procedures.

The ICA addresses the following aspects of continued airworthiness:

- Visual Inspection Procedure
- Pitot-Static Zeroize Procedure
- Airspeed Test and Calibration
- Altimeter Test and Calibration
- Gyro Calibration
- Battery Test and Replacement Procedure

15. Aircraft Flight Manual Supplements

See *AV-30-C Flight Manual Supplement UAV-1004044-001 Revision E*, or later FAA approved revision, for normal, emergency and limitations as required by CFR §23.1581.

Installation-specific details, such as interfaced accessories, must be noted in the supplement by the installer by checking the applicable checkboxes. The supplement must be reviewed and updated as necessary after installation and after changing any interfaced equipment.

16. Serial Interface Specification

GPS serial input is compatible with the "Aviation" and NMEA serial protocols. Aviation protocol is 9600 Baud, No Parity, 8 Data Bits, 1 Stop bit. NMEA is either 4800 or 9600 Baud, No Parity, 8 Data Bits, 1 Stop Bit. BeaconX UCP is 2400 baud, No Parity, 8 Data Bits, 1 Stop Bit.

The packets received are as follows:

Parameter Name	Aviation Packet	NMEA Packet	BeaconX – UCP Transponder Status (v3)
Latitude	"A" Packet	\$GPRMC, Field 4	N/A
Longitude	"B" Packet	\$GPRMC, Fields 5,6	N/A
GPS Track	"C" Packet	\$GPRMC, Field 8	Track Heading
GPS Ground Speed	"D" Packet	\$GPRMC, Field 7	Horizontal Velocity
Distance to Waypoint	"E" Packet	\$GPRMB, Field 10	N/A
Cross Track Error	"G" Packet	\$GPRMB, Field 2	N/A
Desired Track	"I" Packet	\$PGRMH, Field 8	N/A
Waypoint ID	"K" Packet	\$GPRMB, Field 5	N/A
Bearing to Waypoint	"L" Packet	\$GPRMB, Field 11	N/A
Magnetic Variation	"Q" Packet	\$GPRMC, Field 10	N/A
Flight Plan	"w" Packet	\$GPRTE, \$GPWPL	N/A

Table 54: GPS Serial Interface Specification

17. ARINC 429 Interface Specification

When using an AV-HSI, the following ARINC 429 receive messages are processed. Message definitions are per the *General Aviation Manufacturers' Association (GAMA) Publication No. 11, ARINC 429 General Aviation Subset, Version 6*.

Parameter Name	ARINC 429 Label
Flight Plan Header	Label 74
Active Waypoint To From	Label 75
Selected Course	Label 100
Flight Plan Message Checksum	Label 113
GPS Desired Track	Label 114
GPS Waypoint Bearing	Label 115
GPS Crosstrack	Label 116
GPS Vertical Deviation	Label 117
GPS Horizontal Command	Label 121
GPS Magnetic Variation	Label 147
Localizer Deviation	Label 173
Glideslope Deviation	Label 174
VOR Omnibearing	Label 222
GPS Distance To Go	Label 251
GPS Discrete Word	Label 261
LRN Status Word	Label 275
STN Declination Type Class	Label 300
Waypoint Message Length Type Number	Label 303
Waypoint Message Characters 1-3	Label 304
Waypoint Message Characters 4-6	Label 305
Nav Waypoint Airport Latitude	Label 306
Nav Waypoint Airport Longitude	Label 307
Present Position Latitude	Label 310
Present Position Longitude	Label 311
GPS Ground Speed	Label 312
GPS Track	Label 313
DME Arc Radius	Label 325
GPS Lateral Deviation Scale Factor	Label 326
GPS Vertical Deviation Scale Factor	Label 327
Conic Arc Inbound Course	Label 331
Conic Arc Course Change	Label 332
Airport Runway Azimuth	Label 333

Parameter Name	ARINC 429 Label
Airport Runway Length	Label 334
Left/Right Holding Pattern Azimuth	Label 335
Left/Right Procedure Turn Azimuth	Label 340

Table 55: ARINC 429 Receive Specification

The following ARINC 429 messages are transmitted by the AV-HSI:

Parameter Name	ARINC 429 Label
Selected Course	Label 100p
Selected Heading	Label 101g
Selected Altitude	Label 102
Selected Course 2	Label 110
GPS Vertical Deviation	Label 117*
GPS Horizontal Command	Label 121*
Pressure Altitude	Label 203
Baro Corrected Altitude	Label 204
Indicated Airspeed	Label 206
True Airspeed	Label 210
Total Air Temperature	Label 211
Vertical Speed	Label 212
Static Air Temperature	Label 213
Baro In Hg	Label 235
Magnetic Heading	Label 320
* denotes Advanced Autopilot Unlock required	

Table 56: Table 40 – ARINC 429 Transmit Specification

18. Field Update Capability

The unit software can be field updated. Updating requires an in-line harness and Windows based PC, or the optional AV-Link accessory to be installed. Contact uAvionix support for additional information, or reference available Service Bulletins.

Figure 109: Field Update Interface Diagram

19. Appendix A: Example Wiring Schematics

Below are a series of example wiring diagrams showing interconnection between a variety of uAvionix and third-party equipment. While these diagrams show common configurations, they do not enumerate all combinations or options. Extrapolation or interpolation between diagrams may be necessary.

Pitot-static connections are not depicted on these diagrams; however, they are necessary on all AV-30-Cs.

Configuration:

- Single AV-30
- Minimal Install

Install Menu:

- Serial 1: NONE
- Serial 2: NONE
- Serial 3: NONE
- Serial 4: NONE

Notes:

- Use M27500-22TGT14 for Power
- Terminate power shield at AV-30

uAvionix Corporation

Single AV-30 CFG #1

Example Wiring
UAV-1007647-001

Rev B
